APPENDICES

EXECUTIVE SUMMARY

The City of Ann Arbor retained Tetra Tech to perform a Phase I Environmental Site Assessment (ESA) for the City of Ann Arbor ("the City") concerning the property located at 415 W. Washington Street (subject property) as part of the due diligence process. This Phase I ESA was performed in accordance with the scope and limitations specified in the American Society for Testing and Materials (ASTM) Standard E 1527-05. This Phase I ESA has been performed to identify Recognized Environmental Conditions (RECs) at the subject property.

RECs are defined in the ASTM Standard E 1527-05 as the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into the structures on the property or into the ground, groundwater, or surface water for the property. The term includes hazardous substances or petroleum products, even under conditions in compliance with current environmental regulations.

The Phase I ESA for the subject property has identified 8 RECs for the subject property based on available information. RECs include:

1. Chemical Storage Area (two 55-gallon drums of xylene, four unmarked 55-gallon drums, various chemicals, and staining) located in the South Garage;
2. Soil and groundwater beneath the former 10,000 gallon fuel oil AST in the northern portion of the subject property;
3. Soil and groundwater beneath the former 10,000 gallon fuel oil AST in the northeastern portion of the subject property;
4. Potential soil and groundwater impacts beneath the two former 6,000 gallon unleaded gasoline and diesel USTs (tank farm);
5. Soil beneath the salt storage area in the South Garage;
6. Soil beneath the three full fuel tanks in the South Garage;

In addition, the following items which are not RECs but may warrant further consideration were identified in completing this Phase I ESA:

7. Location of AH17-1 soil sample, based on FOIA documents;

8. Location of AH17-2 soil sample, based on FOIA documents;
9. Allen Creek Drain, a listed Part 201 site, located beneath the subject property;
10. Labeled ‘asbestos containing’ wrapped pipes observed within the building;
11. The Eaton Corporation property located south of the subject property; and
12. The U of M Argus Building open leaking underground storage tank (LUST) site and state hazardous waste site (SHWS) located southwest of the subject property.

Historical practices and previously remediated areas include:

13. The former oil house located southeast of the North Garage;
14. The former tar storage area located on the northeastern portion of the property;
15. The former coal storage area located on the northeastern and central portion of the property.

1. INTRODUCTION

1.1 General Site Description

The City of Ann Arbor retained Tetra Tech to perform a Phase I Environmental Site Assessment (ESA) of the property located at 415 W. Washington Street, Ann Arbor, Michigan 48103, herein referred to as the "subject property". The Tax ID numbers for the site are 09-09-29-211-003, 09-09-29-211-017, 09-09-29-211-018 which are comprised of a 2.52 acre lot (**Appendix A**). Generally, the site lies north of W. Liberty Street, west of the Ann Arbor Railroad (AARR) and S. 1st Street, east of 3rd Street and south of W. Washington Street. **Figure 1** depicts the site location and features on the subject property. Groundwater flow direction at the site is assumed to be to the northeast, towards the Huron River.

1.2 Objectives

The objectives of the Phase I ESA for the subject property are to:

- Identify and evaluate environmental conditions at the subject property; and
- Provide an interpretation on the nature of environmental risk or liability that may be present.

This assessment has been completed in general conformance with the American Society for Testing and Materials (ASTM) Standard E 1527-05 – *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process*, as outlined in our proposal. The primary focus of the Phase I ESA process is to identify recognized environmental conditions (RECs) and is limited to the identification of RECs within the scope of the ASTM standard. As defined by ASTM, REC means:

> "the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of release of any hazardous substance or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property. The term includes hazardous substances or petroleum products even under conditions in compliance with laws. The term is not intended to include de minimis conditions that generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies."

This Phase I ESA was completed within and outside of existing structures and features including the north, west, and south garages, first and second floor offices, boiler room, parking

lot, and a visual inspection of the open sheds. This Phase I ESA includes a review of historical information regarding activities on the subject property; review of readily available information concerning the subject property and nearby properties of environmental concern. Phase I ESAs do not include the following:

- Subsurface investigations or inspections within walls or ceilings of buildings;
- Sampling or detailed surveys for lead-based paint, lead in pipes or within drinking water supplies;
- Polychlorinated biphenyls (PCB's) in paint, fluorescent light ballasts, transformers, circuit breakers and other electrical equipment;
- Radon gas or radioactivity;
- Sampling or detailed surveys for Suspected Asbestos Containing Materials; and
- Presence or delineation of wetlands.

A title search was not completed for this property. The findings, conclusions, and interpretations are subject to modification if subsequent information is discovered by Tetra Tech or provided by others. The findings of this report are time-specific and are only representative of site conditions, as they existed at the time of the site visit.

1.3 Description and Current Uses of Subject Property and Surrounding Area

The subject property is zoned as Public Land and Downtown Interface (**Appendix B**). Surrounding properties are located in residentially and commercially zoned areas. A paved entrance drive with gates on the south and north sides of the property provide vehicle access, and leads to an unpaved parking area surrounded by a fence to the east, west and south. Buildings remain on the subject property (**Figure 1**). The U-shaped buildings sit on the west side of the property. The buildings were historically used as a maintenance garage, radio and lawn mower repair shop, carpentry shop, storage garages, and open sheds for the City of Ann Arbor Parks and Recreation Department. Different sections of the U-shaped building were added over time, but the current configuration has been in place since at least 1937 (**Appendix C**). Today, the U-shaped buildings are vacant however portions of the buildings are used to store City of Ann Arbor and Republic Parking Services (RPS) materials. Inside the building, there are miscellaneous paint cans, drums and buckets of flooring epoxy and various chemicals, two skid steers, pallets of road salt, a dumpster, one inaccessible storage area, and refuse. The subject property is fenced off behind the structure on the west end of the site. On the south end of the property, a narrow parking area traverses north/south and connects to the main parking

lot. The large parking lot located on the subject property is currently being leased by the Downtown Development Authority who contracts parking operations to RPS.

Southwest of the subject property is the Liberty Car Wash. North of the subject property is the Ann Arbor YMCA. The AARR bounds the site on the east. Residential properties line W. Washington, west of the subject property. To the east, commercial properties and additional parking lots dominate the area.

2. PAST USES OF SUBJECT PROPERTY AND SURROUNDING AREAS

The following sections present information regarding the past history of the subject property and the surrounding area. Historical information for this site was obtained from aerial photographs, a City Directory database search, Freedom of Information Act (FOIA) documents, and available City of Ann Arbor records.

2.1 Previous Property Owners

The Ann Arbor Electric Light Company, Ann Arbor Fruit Works, Allmendinger and Schneider Cooper Shop, Ann Arbor Organ Company's Lumber Yard, Michigan Milling Co. Bean Warehouse, J.J. Sauer Coal and Lumber Yard, Washtenaw County Road Commission, and City of Ann Arbor have occupied the subject property from 1888 to present.

2.2 Aerial Photography Interpretation

Aerial photographs were reviewed from the years 1937, 1940, 1949, 1955, 1961, 1967, 1978, 1985, 1992, 2000, 2005, and 2006. A satellite image was reviewed from 2012. All aerial photographs are provided in **Appendix C**. The scale and source for each aerial are included in the appendix.

The 1937 aerial photograph indicates that residential land surrounds the subject property with commercial land including several structures east and immediately north of the subject property. Downtown Ann Arbor is east of the property. The AARR runs adjacent to the subject property. The same building configuration appears in the 1937 aerial photograph as the current configuration. Residential buildings surround the subject property to the west, south and further north. A small structure is visible in the central portion of the property in the 1931 and 1937 aerials that may coincide with an aboveground storage tank (AST) and "oil house" identified in the Sanborn maps (see Section 2.4).

Aerial photographs from 1940, 1949, 1955, and 1961 suggest limited change within the subject property and surrounding area. The 1955 aerial appears to have a parking area cleared on the southeastern property boundary, accessible from W. Liberty Street. A building addition is evident on the adjacent property south of the subject property between 1961 and 1967. Multiple vehicles appear to be parked on the subject property beginning in 1955. There are no notable changes in the 1978, 1985, and 1992 aerial photographs. In the 2000 aerial photograph a

possible AST and “oil house” in the central portion of the subject property are no longer apparent.

Between 2000 and 2005, the Ann Arbor YMCA was constructed north of the subject property. The 2005 and 2006 aerial photographs and the satellite image from 2012 illustrate similar land use as today.

2.3 Historical Topographic Map Review

Topographic maps spanning the years 1904 to 1983 were reviewed. The topographic maps are included in this report as **Appendix D**. The scale, source, and date are provided on each topographic map.

The 1904 Ann Arbor topographic map is at a 1:125,000 scale and depicts the general location of the subject property in the northwest corner of the city of Ann Arbor, southwest of the Huron River. Regional land features include a general slope to the north, corresponding to the location of the Huron River, although the subject property is primarily flat. Allen Creek flows north into the Huron River, and through the middle of the subject property. The 1906 1:62,500 scale Dexter quadrangle map provides a topographic view of western Ann Arbor. The 1965 1:24,000 scale Ann Arbor West quadrangle map provides a more focused view of the subject property and surrounding area. There are no structures identified on the subject property, although aerial photographs depict structures dating back to the earliest flight year (1937). The slight northeastern slope of the land surface can be seen. The 1975, and 1983 Ann Arbor West topographic maps are similar to the 1965 map with no significant differences.

2.4 Sanborn Insurance Map Search

Sanborn maps from 1888 to 1972 were reviewed for the subject property. Sanborn maps are provided in **Appendix E**. The Sanborn map from 1888 identifies three buildings on the subject property, with Allen Creek flowing northwest through the center of the property. The Ann Arbor Light Electric Company resides in a building on the north side of the property along W. Washington Street. Ann Arbor Fruit Works and a Cooper Shop occupy the buildings south and west of Allen Creek. The Ann Arbor Central Mills is located on the adjacent property, east of the AARR with a rail spur to the northern portion of the property. Allmendinger Piano & Organ Company is located northeast of the subject property, on the corner of W. Washington and S. 1st Street. Other manufacturing and coal storage are located north of the subject property.

Residential properties line W. Liberty Street and S. 1st Street including the southern portion of the subject property leading to W. Liberty Street.

In the 1892 Sanborn map, the Ann Arbor Fruit & Vinegar Company and the Ann Arbor Electric Light Company have expanded their buildings. A cider mill and vinegar tanks have been added to the Ann Arbor Fruit & Vinegar Company. A coal storage room is identified within the Ann Arbor Electric Light Company. The Allmendinger and Schneider Cooper Shop occupy the northwest portion of the site and a rail spur from the AARR stretches across the property to the Cooper Shop, south of Allen Creek. The Allmendinger Piano & Organ Company is still located northeast of the subject property and Allmendinger & Schneider Central Mills appears to have taken over a portion of the former Ann Arbor Central Mills, east of the AARR. Robert Hunter Machine Shop Foundry and Heinzmann & Laubengayer Elevator and Feed Mill are located north of the subject property

In the 1899 Sanborn map, the Ann Arbor Organ Company's Lumber Yard is located on the subject property. Other site conditions remain the same. Residential parcels appear north of the subject property and the only commercial business is the Ann Arbor Fluff Rug Factory. Coal Storage is replaced with a wood shed and the Ann Arbor Chicory Company has replaced the elevator and feed mill.

The 1908 Sanborn map indicates that the Ann Arbor Electric Light Company has become the Michigan Milling Co. Bean Warehouse. The Ann Arbor Organ Company Lumber Yard has expanded. The Ann Arbor Fruit & Vinegar Company still maintains buildings onsite; however they are identified as 'not in operation'. The Cooper Shop remains next to the lumber yard in the northwest; however the AARR rail spur to the Cooper Shop is absent. Another rail spur traverses north and then northwest to the Michigan Milling Co. Bean Warehouse on the north side of Allen Creek. A smaller unidentified structure is located south of the lumber yard. The Ann Arbor Organ Company and elevator and feed mill remain northeast of the subject property.

Allen Creek is no longer a surface feature in the 1916 Sanborn map. The Ann Arbor Fruit & Vinegar Company has become J.J. Sauer's Coal & Lumber Yard. Coal and lumber is stored on the along the AARR rail spur. A driveway connecting the subject property to W. Liberty Street is observed. The Ann Arbor Organ Company Lumber Yard is not identified although the previously identified 'storage stock' for the lumber has become a flour and feed warehouse.

The cooper shop and Michigan Milling Co. Bean Warehouse remain onsite. The Ann Arbor Organ Company on the corner of W. Washington and 1st Street is now The Superior Mfg. Co. Plant; Automobile Windshield Assembling. The elevator and feed mill is absent; however the Artificial Ice Company is identified. The residential area north of the subject property has expanded.

In the 1925 Sanborn map, the Washtenaw County Road Commission now occupies the northwest corner of the property that was previously the Cooper Shop. An 'oil house' is identified just southeast of the main Road Commission building and numerous smaller buildings are identified. The remaining site features are similar to the 1916 Sanborn map onsite and adjacent to the east. The Superior Mfg. Co. Plant is now the Motor Product Corporation, still manufacturing windshields. The Artificial Ice Company remains. The Ann Arbor Fluff Rug Company located north of residential properties and north of the subject property has been replaced with an expanded building for the American Broach & Machine Company. Residential area remains west and south of the subject property.

The 1931 Sanborn map indicates the expansion of the Washtenaw County Road Commission across the subject property with the exception of the southern parcel facing W. Liberty Street. Two 10,000 gallon aboveground storage tanks (ASTs) are located on the subject property. One is identified as containing fuel oil; the other does not identify the contents. A tar storage garage, four road machinery storage garages, highway equipment and gravel storage, a cement post factory, carpentry shop, machine repair shop, and offices occupy the subject property. A grocery store and a biological supplies warehouse occupy the property directly to the east of the subject property. A filling station occupies the property on the corner of S. 1st Street and W. Liberty Street. The Motor Products Corporation is vacant northeast of the subject property. Directly north, an auto parking lot with two 20,000 gallon gasoline underground storage tanks (USTs) has replaced residential homes.

In the 1948 Sanborn map the Washtenaw County Road Commission expanded their main building to include a road machinery storage garage and an adjacent building for unknown use. The current main building configuration mimics what is onsite today. The tar storage garage, previous four machine storage garages, and highway equipment and gravel storage are no longer on the subject property. The oil house, two ASTs and cement post warehouse remain onsite. A farm equipment and building supplies shop occupies the former grocery store on the

corner of W. Washington and S. 1st Streets. Directly to the east of the subject property on S. 1st Street is a stamping and machine shop, sheet metal shop, and hand laundry shop. A machine shop occupies the property north of the subject property in the former auto parking lot.

In the 1972 Sanborn map, much of the site conditions remain the same. A fuel oil tank is identified on the northeastern portion of the subject property. The residence previously located on the southern portion of the site no longer exists and the parcel is vacant. An auto wash is located adjacent and to the west of the vacant parcel. The AARR rail spur that enters the property is still evident on the map. The former farm equipment and building supplies shop on the corner of W. Washington and S. 1st Street is now the Kiwanis Activities Center. A motorcycle sales and service shop occupies the property that was once the sheet metal and hand laundry shops. The remaining adjacent properties have similar land use as the 1948 Sanborn, although owners have changed.

2.5 City Directories

City directories were reviewed for the years spanning 1915 to 2012, including business directories and telephone directories. The City Directory Report is included in **Appendix F** the source of which is Polk's City Directory. The first listing for 415 W. Washington is in 1915 as the Michigan Milling Company and Cooper Shop. From 1915 to 2007 415 W. Washington was listed as the following:

- Michigan Milling Company, Cooper Shop;
- Washtenaw County Good Roads;
- Washtenaw County Road Commissioners;
- WPA Local Area of Monroe and Washtenaw Counties; Washtenaw County Road Commission;
- Washtenaw County Road Commission; Board of Park Trustees;
- City Board of Parks and Recreation, City Forestry Division, City Parking and Traffic Engineering Division, Huron River Watershed Council, Traffic signs, Signals and Radios;
- City Department of Parks and Recreation;
- City Traffic Control Division;
- City Department of Transportation; and
- Fairview Cemetery and Park Maintenance offices.

According to the Sanborn Maps, the area that occupies 415 W. Washington today included 321, 325, 401, 403, and 411 W. Washington, and 314 W. Liberty Street. From 1915 to 2012, surrounding properties are listed as private residences. Following is a summary of the previous addresses associated with the subject property, according to the City Directory:

Address	Use	Years Listed
321 W. Washington Street	Michigan Milling Company; Feed Warehouse Tractor storage	1915-1927
401 W. Washington Street	Michigan Milling Co., yard	1915-1920

Following is a summary of current nearby addresses and their listed use:

Address	Use	Years Listed
408 W. Washington	American Case Company, Performance Network Theatre Productions, Ann Arbor Civic Theatre	1978-2001
412 W. Washington	Private residence, Barbara Neri Dance Studio	1915-1992
417 W. Washington	Private residence, Commercial Trucking Co., Vacant	1915-1927
421 W. Washington	Private residence, Student Housing, vacant	1915-2012
423 W. Washington	Private residence, Not verified	1915-2012

2.6 Washtenaw County Services Website

The parcel ID number and current owner information were obtained for the subject property (**Appendix A**). Knowledgeable contacts within the City of Ann Arbor were also contacted for other pertinent information regarding past uses of the subject property. These interviews are included in Sections 5 and 6.

2.7 Freedom of Information Act (FOIA) Review

The following information was reviewed and can be located in **Appendix G**.

1. *Environmental Property Assessments for Hawkins, 415 W. Washington Street and Municipal Garage Properties* (1990 Environmental Property Assessment) dated March 5, 1990 and submitted to the City of Ann Arbor Parks and Recreation Department by Environmental Control Technology Corporation (Encotec) of Ann Arbor.

2. *Parks and Recreation Garage Remediation Systems Operation and Maintenance Progress Report* dated February 20, 2001 and submitted to the City of Ann Arbor Public Services Department by NTH Consultants, Ltd (NTH).
3. Michigan Department of Environmental Quality (MDEQ) Leaking Underground Storage Tank (LUST) Facilities List, reviewed September 14, 2012.
4. *Suspected Release from UST at 415 W. Washington, City of Ann Arbor*, dated September 21, 1989 and submitted to Michigan Department of Natural Resources (MDNR) by The Traverse Group, Inc. (TGI).
5. *City of Ann Arbor 415 W. Washington Tank Removal Site Initial Abatement Measures (20 Day Report)*, dated January 9, 1990 and submitted to the MDNR by TGI.
6. *City of Ann Arbor 20 Day Reports, UST Removal Sites*, dated January 19, 1990 and submitted to the MDNR by TGI.
7. *20 Day Report – Initial Abatement Measures City of Ann Arbor Parks and Recreation Building 415 West Washington Street Ann Arbor, Michigan 48103, dated March 13, 1992 and submitted to* MDNR Environmental Response Division (ERD) by TGI.
8. *Tank Removal and Soil Excavation City of Ann Arbor Parks and Recreation Building 415 West Washington Street Ann Arbor, Michigan 48103, dated March 13, 1992 and submitted to* Michigan Department of Natural Resources MDNR ERD by TGI.
9. *45 Day Report The City of Ann Arbor Parks and Recreation Garage 415 West Washington Street Ann Arbor, Michigan*, dated April 17, 1992 and submitted to submitted to MDNR ERD by TGI.
10. *Site Investigation Report For An Underground Storage Tank Release The City of Ann Arbor Parks and Recreation Garage 415 West Washington Street Ann Arbor*, Michigan, dated April 15, 1994 and submitted to MDNR ERD by TGI.
11. *Feasibility Study City of Ann Arbor Parks and Recreation Garage 415 West Washington Street,* dated April 15, 1994 and submitted to MDNR ERD by TGI.
12. *Corrective Action Plan Park & Recreation Garage City of Ann Arbor 415 West Washington Street Ann Arbor, Michigan,* dated March 29, 1996 submitted by NTH to City of Ann Arbor Engineering Division.
13. Michigan State Police Fire Marshall Division Release forms for leaks in the MDEQ LUST database.

Review of one document provided by the City of Ann Arbor, *Environmental Property Assessments for Hawkins, 415 W. Washington Street and Municipal Garage Properties* (*1990*

Environmental Property Assessment) (Reference 1) indicates four soil borings were completed onsite in 1989. Significant soil staining was present as well as an 'oil and/or solvent odor'. Groundwater sampling indicated that the groundwater was not impacted with organic compounds. Various metal concentrations were reported as suspect contamination in each boring. However, a map of these locations is not provided.

Two existing USTs and ASTs were identified onsite. One AST was located on the east property boundary, adjacent to West Washington Street and the AARR. The previous contents or use of the AST are unknown. The second AST was located at the eastern end of the north building complex onsite and was suspected to have held fuel oil for building heat systems. Both ASTs were believed to be empty in 1989. No information was provided on the location of the USTs and according to this document no information was available on their contents.

Review of the MDEQ LUST database (Reference 3) indicates that there were three separate releases documented at the site:

- C-0549-89 reported 09/19/89 of an unknown substance.
- C-1222-89 reported 12/20/89 of an unknown substance.
- C-0371-92 reported 03/06/92 for a gasoline release.

A FOIA request was submitted to the MDEQ and a file review was completed on October 2, 2012. Each of the releases identified above are described in detail from the reports obtained during the file review.

<u>Unknown substance releases (release number C-0549-89 reported 09/19/89 and C-1222-89 reported 12/20/89)</u>

The 1989 releases appear to be from one 1,000-gallon diesel UST. The September 21, 1989 *Suspected Release from UST at 415 W. Washington* letter from TGI to the MDNR (Reference 4) indicates that a 1,000 gallon diesel UST failed a tank tightness test on September 18, 1989. A suspected leak rate of 0.253 gallons/hour was reported, however the tank tester believed an air pocket in the tank or underground piping could have been responsible for failing the tightness test. The suspected release was reported to the State and local Fire Marshall on September 19, 1989. The *Michigan State Police Fire Marshall Suspected Release Form* dated September 19, 1989 is included in **Appendix G**.

The tank was taken out of service and according to the January 9, 1990 *Initial Abatement Measures (20 Day Report)* (Reference 5) the diesel tank was removed from the ground on December 19, 1989. A gasoline odor was noted during removal. The tank was cleaned, rendered useless with a hole cut into the side and transported to a disposal facility. The presence of product was reported to the Michigan Fire Marshall on December 20, 1989. Soil samples were collected from the excavation pit and submitted for analysis of benzene, toluene, ethylbenzene and xylenes (BTEX). The sample from the north end measured in the field at a concentration of 100 parts per million (ppm) with an HNU meter and the sample from the south end near the tank fill pipe screened at 110 ppm. Although the soil appeared discolored, analytical results indicated that BTEX was not detected in the soil. Groundwater and free product were not encountered during the excavation. The site was backfilled to original grade.

Gasoline Release (C-0371-92 reported 03/06/92)

On March 6, 1992 an unleaded gasoline release from an onsite steel 6,000 gallon UST was reported to the Michigan State Police Fire Marshall Division. According to the *20 Day Report – Initial Abatement Measures* dated March 13, 1992 (Reference 7) the unleaded gasoline UST system failed a tank tightness test and hydrocarbon odors were observed. The *45 Day Report* (Reference 9) dated April 17, 1992 indicates that the leaking 6,000 gallon unleaded gasoline UST had a corroded product line, which caused both soil and groundwater impacts. Both the gasoline UST and 6,000 gallon diesel UST, located parallel to each other and 3-feet apart, were emptied of contents on March 9, 1992. The tanks were triple rinsed on March 19, 1992 and removed from the ground the next day.

During the tank excavations, gasoline saturated soil and free product were encountered on the south side of the gasoline UST. The excavation was postponed and the local Fire Marshall was contacted. Under the Fire Marshall's instructions, the free product (approximately five to ten gallons) was soaked up with the overburdened soil. On March 20, 1992, free product was no longer pooling and the excavation resumed. While removing the gasoline UST, free product began pooling again and the Fire Marshal was again contacted. The Fire Marshall poured emulsifier onto the pooling product and the second UST was removed. After the removal of both tanks, approximately 1,200 gallons of light non-aqueous phase liquids (LNAPL) and water were pumped out of the excavation using a vacuum pump. LNAPL continued to enter the excavation and an additional 2,300 gallons of LNAPL and water was pumped out. A total of 198 cubic yards of soil was removed from the site and disposed of at the Ann Arbor Landfill and 192

cubic yards of concrete were landfilled at Belleville, Michigan. Water samples were collected from the water in the excavation for waste characterization. The laboratory analytical results reported total BTEX constituents at 58.9 ppm.

Three monitoring wells were installed (MW-1 through MW-3). Monitoring wells MW-2 and MW-3 had a sheen on the water surface and MW-1 had approximately 33 inches of LNAPL present after installation and development. On April 13, 1992 the excavation was backfilled and a 12-inch diameter LNAPL recovery well was installed eight feet southwest of MW-1.

The April 15, 1994 *Site Investigation Report For An Underground Storage Tank Release* summarizes the site investigation work that took place following the *45 Day Report* (Reference 10). In April and May 1992, 17 gallons of LNAPL were recovered and a more permanent recovery system was installed. A skimmer separated and pumped approximately 40 gallons of LNAPL to an AST.

Between June 1992 and November 1993 eight additional monitoring wells and seventeen soil borings were completed in order to delineate the extent of hydrocarbon-affected resources onsite and characterize the site geology. According to this report, current soil and groundwater contamination boundaries were established horizontally and vertically. However, soil detections reported from Auger Holes AH17-1 and AH17-2 were not delineated. Auger Hole AH17-1 was located on the northeastern portion of the property, south of the former AST and Auger Hole AH17-2 was located off the northeast corner of the Pole Barn (Open Sheds) and adjacent to Allen Creek. These locations were believed to be unrelated to the former USTs; however polynuclear aromatic hydrocarbons (PNAs) below the Type B Criteria were detected in both locations. Total PNAs were detected in AH17-1 (2-4 feet) at 930 parts per billion (ppb), AH17-1 (4-6 feet) at 1,500 ppb and AH17-2 (2-4 feet) at 7,390 ppb. Individual PNA parameters were not reported in the document and cannot be compared to current criteria.

The April 15, 1994 *Feasibility Study* (Reference 11) outlines possible remedial action alternatives TGI proposed for the subject property. The March 29, 1996 *Corrective Action Plan* (Reference 12), summarizes the pilot testing completed to evaluate the possible remediation technologies for the site. Based on the results of the investigation and pilot test the city decided to use pump and treat, soil vapor extraction and air sparging to remediate impacts. The cover

letter to the *Corrective Action Plan* indicates 3,200 gallons of LNAPL and water had been recovered to date.

According to the information provided in the City's request for proposal (RFP) and the provided 2001 *Parks and Recreation Garage Remediation Systems Operation and Maintenance Report* (Reference 2), the remediation system was installed in 1997 to remove the contamination from soil and groundwater. Groundwater wells were routinely sampled from 1997 to June 2003 for BTEX and PNAs. In order to reach site closure, the MDEQ required at least six consecutive months of data below 5 parts per billion (residential cleanup standards) for benzene. During this sampling timeframe, two of these wells (MW-6 and MW-11) periodically had detections of benzene which prohibited site closure. The remediation system was turned off in December 2002 before closure was obtained.

2.8 Part 201 Database Review

The MDEQ Part 201 Database was reviewed to determine if sites are located adjacent to the subject property. Allen Creek, which traverses the property within the stormwater drain is a Part 201 site for BTEX contamination. The MDEQ Part 201 Database indicates that an interim response is in progress for the site listed on June 18, 2004 at 912 N. Main Street (presumably the address where Allen Creek discharges to the Huron River), which is downgradient of the subject property. Records identifying the presence, extent and origin of BTEX contamination in Allen Creek were not available for this Phase I ESA. A comprehensive file review or additional onsite sampling is needed to determine if these sites are RECs for the subject property.

The U of M Argus Building (400 4th Street), Eaton Corporation (315 S. 1st Street), and Ann Arbor YMCA (396-424 W. Washington Street) are also listed on the MDEQ Part 201 Database. The MDEQ Part 201 Database indicates that an interim response has been conducted for the Eaton Corporation, an evaluation has been conducted for the Ann Arbor YMCA property, and the U of M Argus Building is listed as a MDEQ Part 213 site. These will be discussed in Section 3.

3. ENVIRONMENTAL RECORDS REVIEW

Environmental Data Resources (EDR), Inc., conducted a thorough regulatory review of all available State of Michigan and Federal lists of area sites of environmental concern on January 14, 2013. The environmental database searches are summarized below. EDR's complete report is provided as **Appendix H**. The search radii for each applicable database are per the ASTM Standard. The source and date of the government version of each database is provided in the Data Currency Tracking section of EDR's report. Each site listed in these databases has been evaluated to assess the likelihood of impacting the subject property; however, the objective of this Phase I ESA is to ascertain whether the use of the subject property by its tenants has impacted the subject property and whether adjacent properties have the potential to impact the subject property. Information provided in this section is from the EDR report unless otherwise stated.

3.1 Subject Property Database Hits

The subject property was identified in 6 databases on the EDR report:

- Resource Conservation and Recovery Act Non-Generator (RCRA-NonGen); a database that indicates that the subject property does not generate hazardous waste.
- Facility Index System (FINDS); a database that contains facility information about various compliance reporting requirements for the subject property.
- Waste Data System (WDS); a database that tracks activities at facilities regulated by the Solid Waste, Scrap Tire, Hazardous Waste and Liquid Industrial Waste programs.
- LUST; database that indicates a release has occurred from a UST at the subject property.
- Underground Storage Tank (UST); database that indicates registered USTs are located on the subject property.
- Permit and Emissions Inventory Data (AIRS – Aerometric Information Retrieval System); database that indicates the subject property is included in this inventory for air quality data.

3.2 National Priorities List

The subject property is not included on the National Priorities List (NPL), a list compiled by the U.S. Environmental Protection Agency (U.S. EPA) of contaminated sites, otherwise known as Superfund, under the Comprehensive Environmental Response, Compensation, and Liability

Act (CERCLA), to record risks to human health and the environment associated with contaminated water, soils or air. A review of the database identified no NPL sites within one mile of the subject property.

3.3 Proposed National Priorities List

The subject property is not listed on the Proposed National Priorities List (PNPL) database. This database lists properties proposed for the NPL. No PNPL sites are listed within one mile of the subject property.

3.4 Delisted National Priorities List

The subject property is not listed on the Delisted National Priorities List (DNPL) database. This database lists properties that were once on the National Priorities List but have since been delisted. No DNPL sites are listed within one mile of the subject property.

3.5 National Priorities List Liens

The subject property is not listed on the Federal Superfund Liens database.

3.6 Comprehensive Environmental Response, Compensation, and Liability Information System

The subject property does not appear on the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) database, a listing of known and suspected uncontrolled or abandoned hazardous waste sites throughout the nation, maintained and compiled by the U.S. EPA, Office of Solid Waste and Emergency Response. CERCLIS contains all possible, proposed, and confirmed NPL sites. A review of the database identified one CERCLA site within one-half mile of the subject property. Armen cleaners (603 South Ashley) is located cross gradient of the subject property, therefore it does not pose a REC.

3.7 Comprehensive Environmental Response, Compensations, and Liability Information System, No Further Action Planned

The subject property is not listed on the CERCLIS-No Further Remedial Action Planned (NFRAP) database, a listing of sites that have been removed from the CERCLIS database. NFRAP are sites where contamination was not found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require NPL consideration. The database search listed one site within one-half mile of the subject property. Armen Cleaners (603 S. Ashley) is located cross gradient of the subject property. CERCLIS-NFRAP sites have been removed and archived from the inventory of CERCLIS sites. Therefore, this site does not pose a risk to the subject property.

3.8 Corrective Action Report

The U.S. EPA maintains a Corrective Action (CORRACTS) database of RCRA facilities, which are undergoing "corrective action." The subject property was not listed in the database and no sites were identified within one mile of the subject property.

3.9 Resource Conservation and Recovery Act – Treatment, Storage and Disposal

The subject property does not appear on the Resource Conservation and Recovery Act (RCRA)-Treatment, Storage and Disposal (TSD), which includes information on sites that generate hazardous wastes and those which operate TSD facilities, as defined by RCRA. The RCRA database did not identify any RCRA-TSD sites within one-half mile of the subject property.

3.10 Resource Conservation and Recovery Act Generator

The RCRA – Conditionally Exempt Large and Small Quantity Generators (CELQG and CESQG, respectively) contains information on hazardous waste handlers regulated by the U.S. EPA under RCRA, RCRA notifiers, transporters, and formerly regulated RCRA sites. CESQGs generate less than 100 kilograms (kg) of hazardous waste or less than 1 kg of acutely hazardous waste per month. There were eight CESQGs identified within one-quarter mile of the subject property.

Property Name	Address
GT Products Inc. (Site name: Eaton Corporation)	315 S. 1st St.
Morningside Ann Arbor LLC (Site name: Eaton Corporation)	305 W. Liberty St.
Ross-Beakes Collision	314 W. Ann St.
Sir Speedy	350 S. Main St.
University of Michigan	400 S. 4th St.
Emre Fuel Inc.	402 S. Main St.
National City Bank	101 S. Main St.
Sheesh[1]	207 N. Main St.

1. Restaurant no longer in business as of August 22, 2011.

Three violations were reported for GT Products Inc. in 1998 and 2003. Compliance was achieved for all three violations. No violations were found for the remaining RCRA-CESQGs.

3.11 Emergency Response Notification System

The Emergency Response Notification System (ERNS) contains information on specific notification of release of oil and hazardous substances into the environment. The search radius includes only the subject property and it is not listed in the database.

3.12 State Hazardous Waste Sites

The State Hazardous Waste Site (SHWS) database contains information on sites that are the state equivalent of CERCLIS sites. These sites may or may not be listed in the CERCLIS database. These are priority sites planned for cleanup using State funds. The subject property was not listed in the database. Nine properties were identified in the SHWS database search. Each of the properties is located within one mile of the subject property. Regional groundwater flow is assumed to be to the northeast, towards the Huron River.

Property Name	Address	Direction and Distance from Subject Property	Potential REC?
Ann Arbor YMCA (Former site use history)	396-424 W. Washington	N 0-$^1/_8$ mile	No
815 Wildt St.	815 Wildt St.	NNE ½-1 mile	No
H and K Campus Properties	212-216 S. State St.	E ½-1 mile	No
Eaton Corporation	315 S. 1st St.	SSE 0 - $^1/_8$ mile	Yes
U of M Argus Building	400 4th St.	SW $^1/_8$ -¼ mile	Yes
Armen Cleaners	630 S. Ashley	SSE ¼ - ½ mile	No
Sheffield Pharmaceuticals	912 N. Main St.	NNE ½ - 1 mile	No
MichCon	841 Broadway St.	NE ½ – 1 mile	No
Ann Arbor Art Train[1]	1100 N. Main St.	NNE ½ - 1 mile	No

1. The address corresponds with the former Lansky's Junkyard.

Six of the above SHWS sites do not pose a potential REC to the subject property. Based on the direction of groundwater flow, the U of M Argus Building and Eaton Corporation properties could pose a risk. Armen Cleaners is located cross gradient of the subject property, so this property does not pose a risk.

3.13 Solid Waste Facilities Database

The Solid Waste Facilities Database (SWF/LF) lists solid waste disposal facilities or landfills in Michigan. These may be active or inactive facilities or open dumps that failed to meet RCRA Subtitle D, Section 4004 criteria for solid waste landfills or disposal sites. The subject property

was not listed in the database and no sites were identified within one mile of the subject property.

3.14 Leaking Underground Storage Tank

The LUST list provides information on known leaking underground storage tanks in the State. In addition to the subject property, twenty-five LUST sites were identified in the database search within one-half mile of the subject property. Below is a table summarizing the LUST sites within one-half mile of the subject property.

Property Name	Address	Release Date	Substance Released	Release Status
Beakes St. Service Station	101 Beakes St.	9/27/1989	Not reported	Closed
Braum Family Agency	601 S. Main St.	4/26/1994	Gasoline	Open
De Long BBQ Pit	314 Detroit St.	3/14/2001	Other	Closed
University Fuel Mart	300 N. Main St.	3/3/1992	Gasoline	Closed
Bill Muncy's Service	423 Miller Ave.	2/2/1999	Unknown	Closed
City of Ann Arbor Fire Department	111 N. 5th Ave.	9/10/1992	Diesel	Closed
Ashley Terrance Development	208 W. Huron St.	7/24/2006	Gasoline, diesel	Closed
City of Ann Arbor	100 N. 5th Ave.	9/28/2011	Diesel	Closed
Comerica Bank	300 E. Huron St.	10/8/1991	Not reported	Closed
Comerica Bank	312-314 E. Huron St.	10/9/1991	Unknown	Closed
Ann Arbor Co.	324 E. Huron St.	11/20/1991	Unknown	Closed
WCP Investments Partnership	117 N. 1st St.	3/19/1991	Unknown	Closed
Illis Auto Service	401 W Huron St.	10/6/1988	Not reported	Closed
Budget Rent A Car	200 S. Ashley St.	4/28/1993	Gasoline	Closed
Campus Auto	202 S. Division St.	9/22/1994	Gasoline	Closed
Ann Arbor Implement Co.	210 S. 1st St.	6/11/1993	Gasoline	Closed
Japanese Auto	563 S. Main St.	01/04/2000	Used Oil	Open
Liberty Street[1]	221 W. Liberty	7/13/2004	Not reported	Open

C.B. Development	220 Felch St.	5/26/1992 5/28/1992 6/4/1992	Diesel Diesel Gasoline	Closed Closed Closed
Dale Krull Construction	221 Felch St.	5/27/1992	Diesel	Closed
Fingerle Lumber Co.	202 E. Madison	12/19/1990	Diesel	Closed
U of M Argus Building	400 4th St.	2/14/1990	Not Reported	Open
Emre Fuel Inc.	402 S. Main St.	10/25/1991 5/22/2002	Unknown Gasoline	Closed Closed
Main Street Gas Station	428 S. Main St.	10/18/1991	Unknown	Closed
A & L Parts Inc.	521 S. Ashley	04/08/1992	Unknown	Closed
Parks and Recreation (Subject Property)	415 W. Washington St.	3/6/1992 9/19/1989 12/20/1989	Gasoline Not reported Not reported	Open Open Open

1. This address coincides with Pizza Pino today.

Releases from closed LUST sites listed above do not pose a risk to the subject property because of their release status, distance or direction relative to the subject property. The U of M Argus Building poses a potential REC to the subject property because of its proximity and it is upgradient in the direction of groundwater flow. The remaining open status LUST sites are downgradient or cross gradient of the subject property, therefore they do not pose a potential REC.

3.15 Underground Storage Tank and Above Ground Storage Tanks

The Registered UST list provides information for all registered USTs in the State. Ten UST sites were identified in the database search within one-quarter mile of the subject property.

Property Name	Address	In use?	Removed or Closed in place?
Modern Car Wash	318 W. Liberty St.	No	Yes
JB's Auto Service	325 W. Liberty St.	Unknown	Unknown
Ann Arbor Implement Co.	210 S. 1st St.	No	Yes
WCP Investments Partnership	117 N. 1st St.	No	Yes
Budget Rent-A-Car	200 S. Ashley St.	No	Yes

Ro-An Realty Co.	218-220 W. Huron St.	No	Yes
Ashley Terrance Development	208 W. Huron St.	No	Yes
Emre Fuel Inc.	402 S. Main St.	Yes	Yes – 5 Removed 3 Currently in use
Main Street Gas Station	428 S. Main St.	No	Yes
Bill Muncy's Service	423 Miller Ave.	No	Yes
Liberty Street[1]	221 W. Liberty	No	Unknown[2]

1 = This address coincides with Pizza Pino today.
2 = UST site listed on the orphan site summary and is within the search radius of ¼ mile of the subject property.

Seven of the above UST sites are also listed on the LUST site list. The LUSTs are closed and the USTs in use have no releases reported. Emre Fuel Inc., the only UST site with active tanks, is located cross gradient of the subject property. If a release occurred it would not pose a potential REC to the subject property due to the direction of groundwater flow.

3.16 Activity and Use Limitations

Sites listed in the Activity and Use Limitations (AUL) database are sites with engineering and/or institutional controls in place. DeLong BBQ Pit (314 Detroit St.) is listed in the database search and the site is restricted to commercial III or IV property. DeLong BBQ Pit is located $^1/_4$ – ½ mile cross gradient of the subject property. Fingerle Lumber Co. (617 S. 5th Ave.) is located ¼ - ½ mile cross gradient of the subject property. Bill Muncy's Service (423 Miller Ave.) is listed on the database search as having site-specific restrictions, groundwater consumption restrictions, excavation and soil movement restrictions, and a site health and safety plan. Bill Muncy's Service is located $^1/_8$ - ¼ mile north of the subject. This site is downgradient of the subject property and is not expected to pose a risk to the subject property.

3.17 Brownfields

The brownfields list contains information regarding brownfields properties addressed by the U.S. EPA Targeted Brownfields Assessments program, which is designed to help states, tribes, and municipalities minimize the uncertainties of contamination often associated with brownfields. Three brownfield sites appeared in the database search.

Property Name	Address	Cleanup Required?	Cleanup conducted?
Armen Cleaners	630 S. Ashley St.	Unknown	Interim Response in

			Progress[1]
226 W. Liberty St.	226 W. Liberty St.	Yes	Unknown
200 S. Ashley St.	200 S. Ashley St.	Yes	Unknown[2]

1 = An internet search found that no interim response is in progress as of June 23, 2012.
http://annarborchronicle.com/2012/06/23/ann-arbor-city-council-oks-618-s-main/

2 = EDR indicates soil was affected and cleaned up. It is unknown if any other media were affected.

The sites listed at 200 S. Ashley and 226 W. Liberty are within 0 – $^1/_8$ mile east and southeast of the subject property respectively. Based on cross gradient groundwater flow, these sites do not pose a potential risk to the subject property.

3.18 Baseline Environmental Assessment Sites

The Baseline Environmental Assessment (BEA) Database provides a listing of all sites for which a BEA has been completed. The subject property is not listed as a BEA site. The database search identified 13 BEA sites within one-half mile of the subject property.

- 507-511 S. Ashley St.
- 110 Miller Ave.
- 314 Detroit St.
- 204 W. Huron St.
- 200 S. Ashley St.
- 220 Felch St.
- 202 S. Division St.
- 221 W. Liberty St.
- 521 S. Ashley St.
- 502 S. Main St.
- 551 S. 4th St.
- 552-564 S. Main St.
- 601 S. Main St.

These sites are not expected to pose a risk based on their BEA status.

3.19 RCRA-Non Generator Sites

RCRA Non-Generator sites included in the database include selective information of sites which transport, store, and/or dispose of hazardous waste, but do not currently generate hazardous waste. There were ten RCRA-NonGen sites listed within ¼ mile of the subject property.

Property Name	Address
Ann Arbor YMCA (current occupant) (Former site use history)	400 W. Washington St.
Painters Supply & Equipment	211 W. Liberty St.
Thermo Analytical ENVR Research	117 N. 1st St.
Ashley Group LLC	213-215 S. Ashley St.
Ro-An Realty Co	208 W. Huron St.
W. Washington Street Association	112 W. Washington St.
Great Copy Co.	110 E. Washington St.
City of Ann Arbor	111 N. Main St.
2020 Communications	106 N. 4th Ave.
Ann Arbor Circuits Inc.	424 W. Washington St.

Thermo Analytical Environmental Research has received a violation in the area of 'Generators – General' in 1987, however the specific regulation violated was not reported. Notice of this violation was received and an onsite compliance evaluation was performed. Ann Arbor Circuits Inc. received two violations in 1988 and one in 1997 in the area of 'Generators – General', and 'Generators – Pre-Transport'. The specific regulation violated was not reported. Notice of these violations was received and onsite compliance evaluations were performed. No other RCRA-NonGen sites received violations.

3.20 Delisted Contaminated Sites

Delisted State Hazardous Waste Sites (DELSHWS) have been deleted from the List of Contaminated Sites. A review of the DELSHWS lists revealed one site within one mile of the subject property. Montgomery Pumping Station (432 Montgomery) was delisted because it no longer met criteria specified for DELSHWS sites.

3.21 Dry Cleaners

According to the EDR radius report, no drycleaners were found within a ¼ mile of the subject property.

3.22 Manufactured Gas Plant Sites

The EDR Proprietary Manufactured Gas Plant (MGP) Database includes records of coal gas plants. Materials and byproducts of gas production are frequently disposed of at the plant site and can remain, serving as a continuous source of soil and groundwater contamination. A review of the MGPs within one mile of the subject property revealed two sites. Both sites are

located northeast of the subject property. City Gas Works (Beakes Street) and The Ann Arbor Gas Company (Broadway Street) are downgradient of the subject property and do not pose a risk to the subject property.

3.23 Orphan Sites

EDR designates a listed site as an Orphan Site when the address cannot be properly located. EDR identified twenty Orphan Sites in the summary. Each of the twenty-seven listed orphan sites was identified and six are within one mile of the subject property. These include the following:

Site Name	Data Base
MI Dept/Natural Resources and Environment	RCRA NonGen / NLR
Madison and Main Streets.	BROWNFIELDS
Eaton Corporation – Ann Arbor	BEA
MichCon Beakes Street	Hazardous Waste Site (HWS)
401 & 411 E. Washington	BEA
391 & 401 Miller Rd.	BEA

The Orphan Site at the east bank of Argo Pond in the Huron River (MI Dept/Natural Resources and Environment) is a listed RCRA NonGen/NLR site. The site is located north of the subject property. Because the direction of regional groundwater flow is to the north-northeast, this site does not pose a risk to the subject property.

The Orphan Site at Madison and Main Streets is listed as a Brownfields site. No additional information was available for this site. Based on the direction of groundwater flow however, this site does not pose a risk to the subject property.

The Orphan Site at the southwest corner of S. 1st Street and W. Liberty Street (Eaton Corporation – Ann Arbor) is a listed BEA site. Since this site is upgradient of the subject property, in the direction of groundwater flow, and is listed on the SHWS database, it does pose a potential risk to the site. The Orphan Site at 401 and 411 E. Washington, and 391 and 401 Miller Road are also listed BEA sites. The sites are cross gradient or downgradient of the subject property, therefore these sites do not pose a risk.

The MichCon Beakes Street site is listed as a SHWS and is within 2,000 feet of the subject property. The site is located northeast of the subject property. Because the direction of regional groundwater flow is to the northeast, this site does not pose a risk to the subject property. An interim response is in progress for a portion of this site. An article published on the Ann Arbor.com website describes the remedial work at the site and the progress made as of January 3, 2013 (http://www.annarbor.com/news/dte-energy-calls-michcon-cleanup-success/).

4. PHYSICAL SETTING

The topography at the subject property is generally flat; gently sloping north-northeast, toward the Huron River. West of the subject property, the topography is sloping to the east. The subject property is approximately 2,000 feet southwest of the Huron River and is partially bound by a 20-foot high AARR embankment to the east and a 20-foot high slope to the south at the Liberty Car Wash located at 318 W. Liberty St.

The United States Department of Agriculture Web Soil Survey indicates that two soil units were mapped across the subject property, Fox sandy loam, and Matherton sandy loam (**Appendix I**). These soils are described as level to very gently sloping. The Matherton sandy loam is described as somewhat poorly drained, while the Fox sandy loam is described as well drained. The site is located within an area classified as urban land. This classification indicates that soils have been mechanically re-worked thus making the original soil properties no longer evident. The bedrock geology is described as Mississippian Coldwater Shale by W.R. Farrand, 1982.

Allen Creek traverses northwest to north through the subject property before turning northeast toward the Huron River. The creek was re-routed through storm sewers underground, sometime between 1908 and 1916 in accordance with the Sanborn Maps. The subject property sits primarily on the floodway and flood fringe of the Huron River, and a small section of the subject property is upland (**Appendix J**).

5. KNOWLEDGEABLE SITE CONTACTS

Joy Gryzenia interviewed City of Ann Arbor Senior Engineer Elizabeth Rolla, on January 18, 2013. Ms. Rolla was the project manager for remediation activities at the subject property. During a phone interview with Elizabeth Rolla on January 18, 2013, the following information was noted:

- The USTs were used by the Field Services Department for fueling lawn mowers and equipment.
- There were multiple USTs onsite that had leaked. The tanks were removed and a remediation system was installed. The exact number and contents of the tanks are unknown.
- Remediation at the site began in 1997 with the installation of a pump and treat system and air sparge units.
- The system was successful in removing concentrations of BTEX and PNA compounds below Part 213 Tier 1 residential groundwater criteria in all monitoring wells except MW-6 and MW-11.
- In a memo dated June 25, 2004, Ms. Rolla recommended that NTH Consultants continue to remediate the subject property by re-installing MW-11 and continuing groundwater sampling at the site. It was thought that natural attenuation would likely bring benzene concentrations in MW-6 and MW-11 below MDEQ criteria.
- No additional work was completed, including re-installation of MW-11.
- The remediation system onsite was turned off, but to Ms. Rolla's knowledge nothing was removed from the system making it inoperable.

6. SITE RECONNAISSANCE

Site reconnaissance was conducted on the subject property on January 15, 2013 by Ms. Joy Gryzenia, Project Geologist with Tetra Tech. Ms. Gryzenia was accompanied during the onsite reconnaissance by Mr. Kevin Johnson, a ten year veteran of the City of Ann Arbor Parks and Recreation Department. Mr. Johnson provided information about the City of Ann Arbor's historical use of the subject property and was able to provide site access. The purpose of the site visit was to assess the current land use and identify potential environmental concerns at the subject property.

A U-shaped set of buildings are located on the subject property. The buildings are divided into four sections: The North Garage, West Garage, South Garage, and Open Sheds (**Figures 1 and 2**). All three garage areas were inspected, including offices located on the second floor of the North Garage. During the site reconnaissance, the interior of the North and West Garages were found to be used as storage for RPS and City of Ann Arbor equipment. The South Garage is currently used for chemical, salt, and equipment storage. The Open Sheds are surrounded by fences, prohibiting access, although the interior of the sheds are visible. The Open Sheds are vacant. A gravel parking lot and vacant area behind the South Garage were included in the site reconnaissance. A remediation system was observed south of the North Garage, but was not accessible. The following sections include details of observations made during the site reconnaissance. Photographs taken during the site reconnaissance are included in **Appendix K**.

6.1 Observations

The following sections present specific observations made during the reconnaissance of the interior and exterior during the on-site reconnaissance.

6.2 Hazardous Substances and Petroleum Products

Three full portable gas tanks were observed at the subject property. The tanks appeared to have a 100 gallon capacity and there was no evidence of staining. The tanks were located within the South Garage. The existence of the petroleum product requires the propane tanks be classified as a REC.

Heavy machinery equipment was disassembled on the ground of the South Garage. Disconnected hydraulic oil lines were observed. A stain on the ground was observed and

absorbent material was placed on top of the stain. The stain appeared de minimis. A stain from an unknown source was visible on the ground near the west wall of the south garage.

Mercury containing thermostats and Americium 241-containing smoke detectors were located inside the offices above the North Garage.

Two 55-gallon drums of xylene were found in the South Garage. The drums were not placed on a containment pad, however, no stains were observed around the drums. The existence of the drums of xylene requires this area be classified as a REC.

Lawn mowers were repaired in the West Garage. Hydrocarbons are not known to have been used in the West Garage but the potential exists. Upon inspection of the concrete floor, no cracks or pits were observed. This does not pose a risk to the subject property.

6.3 Storage Tanks

No storage tanks were observed during the site reconnaissance.

6.4 Pool of Liquid

No pooling liquid was identified.

6.5 Drums

Two 55-gallon drums of urethane deck coating, two 55-gallon drums of xylene, four unmarked full 55-gallon drums, and two 40-gallon and one 55-gallon drums of compound cleaning liquid were found in the South Garage. The existence of these drums requires they be classified as a REC.

6.6 Unidentified Substance Containers

Multiple paint cans, bottles, one and two gallon metal containers, four 55-gallon drums, and spray cans were observed inside the South Garage. The contents were contained and there was no visible evidence of leaking on the container. The four unmarked full 55-gallon drums represent a REC.

6.7 Polychlorinated Biphenyls

No PCB-containing transformers were identified on or near the subject property.

6.8 Pits, Ponds, or Lagoons

No pits, ponds or lagoons were identified on the subject property.

6.9 Soil Inspection

Stained soil was not observed on the exterior portions of the subject property during the site reconnaissance.

6.10 Stressed Vegetation

Stressed vegetation was not observed on the subject property during the site reconnaissance.

6.11 Odors

An olfactory observation was noted inside the South Garage. Chemicals stored inside this building, are likely the source of the odor.

6.12 Solid Waste

A solid waste dumpster is located inside the South Garage. Solid waste can be found throughout the buildings.

6.13 Waste Water

Sanitary sewer manholes are located onsite. Stormwater sewers are also located throughout the subject property. It is unknown if the drains inside the South Garage salt storage area lead to the sanitary system or the stormwater sewer system.

6.14 Wells

The subject property is currently serviced by a municipal water supply. Eight monitoring wells and three nested piezometers were observed during the site reconnaissance. The wells are primarily positioned around the remediation system. City employees confirmed that these wells were installed during the LUST cleanup. The remediation system is surrounded by a chain-linked fence that does not have a gate, making it is inaccessible.

6.15 Septic Systems

An onsite septic system was not observed during the site reconnaissance. The subject property uses the municipal sanitary sewer.

6.16 Sumps and Trenches

A sump and associated trench is located within the boiler room, east of the North Garage. The trench and sump appeared to be dry. A set of trenches and drains were observed in the North Garage that were filled with soil. Previous usage of the trenches and drains are unknown.

7. FINDINGS AND CONCLUSIONS

This report presents the findings of a Phase I ESA for the City of Ann Arbor property located at 415 W. Washington Street, Ann Arbor, Michigan, Washtenaw County (subject property) in conformance with the scope and limitations of ASTM Standard E 1527-05. The Phase I ESA was conducted for the purpose of providing information on current environmental conditions of the subject property. The Phase I ESA process involves reviewing site information, searching relevant government databases, performing interviews with persons knowledgeable with site use and completing a visual reconnaissance of the site in order to identify RECs.

The Phase I ESA for the subject property has identified 8 RECs for the subject property based on available information. RECs include:

1. Chemical Storage Area (two 55-gallon drums of xylene, four unmarked 55-gallon drums, various chemicals, and staining) located in the South Garage;
2. Soil and groundwater beneath the former 10,000 gallon fuel oil AST in the northern portion of the subject property;
3. Soil and groundwater beneath the former 10,000 gallon fuel oil AST in the northeastern portion of the subject property;
4. Potential soil and groundwater impacts beneath the two former 6,000 gallon unleaded gasoline and diesel USTs (tank farm);
5. Soil beneath the salt storage area in the South Garage; and
6. Soil beneath the three full fuel tanks in the South Garage.

In addition, the following items which are not RECs but may warrant further consideration were identified in completing this Phase I ESA:

7. Location of AH17-1 soil sample, based on FOIA documents;
8. Location of AH17-2 soil sample, based on FOIA documents;
9. Allen Creek Drain, a listed Part 201 site, located beneath the subject property;
10. Labeled ‘asbestos containing’ wrapped pipes observed within the building;
11. The Eaton Corporation property located south of the subject property; and

12. The U of M Argus Building open leaking underground storage tank (LUST) site and state hazardous waste site (SHWS) located southwest of the subject property.

Historical practices and previously remediated areas include:

13. The former oil house located southeast of the North Garage;
14. The former tar storage area located on the northeastern portion of the property;
15. The former coal storage area located on the northeastern and central portion of the property.

8. SCOPE OF ACTIVITY

This Phase I ESA has been completed in a manner consistent with the level of care and skill ordinarily exercised by other professional consultants under similar circumstances. It is based on the application of scientific principles and professional judgment to certain facts with resultant subjective interpretations. The professional judgments expressed herein are based on facts currently available within the limits of the exiting data, scope of work, budget, and schedule. To the extent that more definitive conclusions are desired by the client than are warranted by the currently available facts, it is specifically Tetra Tech's intent that the conclusions and recommendations stated herein be intended as guidance, and not necessarily a firm course of action, except where explicitly stated as such. We make no warranties, expressed or implied, including without limitations, and warranties as to merchantability or fitness of the property for a particular purpose. In addition, the information provided to you in this report is not to be construed as legal advice.

8.1 Limitation of Use of this Report

Tetra Tech is not engaged in environmental assessment and reporting for the purpose of advertising, sales promotion, or endorsement of any client's interest, including raising investment capital, recommending investment decisions, or other publicity purposes. Client acknowledges that this report has been prepared for their exclusive use, and agrees that reports or correspondence from Tetra Tech will not be used or reproduced in full or in any part for such purposes, and may not be used or relied upon in any prospectus or offering circular. Client also agrees that none of the advertising, sales promotion or other publicity information obtained from this environmental assessment and report will mention or imply the name of Tetra Tech.

8.2 Limitations and Exceptions

The findings, conclusions, and interpretations are subject to modification if subsequent information is developed by Tetra Tech or others. The findings of this report are time-specific and are only representative of subject property conditions as they existed at the time of the site visit.

This report has been prepared for the benefit of the City of Ann Arbor and was compiled based partially on information supplied to Tetra Tech from outside sources and other information in the public domain. Tetra Tech has examined and relied on documents referenced in this report and on oral statements made by certain individuals. Tetra Tech has not conducted an independent

examination of the facts contained in referenced materials and statements. Tetra Tech has assumed that the documents are genuine and that the information provided in documents or statements is true and accurate. Tetra Tech has prepared this report in a professional manner, using the degree of skill and care exercised for similar projects under similar conditions by reputable and competent environmental consultants. The opinions herein are based on the information Tetra Tech obtained while compiling the report. Tetra Tech makes no warranty as to the accuracy of statements made by others that may be contained in this report, nor are any other warranties or guarantees, expressed or implied, included or intended by the report, except that it has been prepared in accordance with the current generally accepted practices and standards consistent with the level of care and skill exercised under similar circumstances by other professional consultants or firms performing the same or similar services. Differing conclusions about environmental features could be reached because the facts that form the basis for the report are subject to professional interpretation. Tetra Tech does not assume responsibility for the discovery and elimination of hazards that could cause accidents, injuries, or damage. Compliance with submitted recommendations or suggestions does not ensure that hazards will be eliminated or the City of Ann Arbor's obligations will be fulfilled under local, state, or federal laws or any modifications or changes to these laws. None of the work performed shall constitute or be represented as a legal opinion of any kind or nature, but shall be a representation of findings of fact from records examined.

The information contained in this report, including all exhibits and attachments, may not be used by any other party without the express written consent of the City of Ann Arbor or Tetra Tech. This report is partially based on information obtained from City of Ann Arbor files and personnel. Tetra Tech does not guarantee the authenticity or reliability of the information it has received from these sources.

Qualifications of the Environmental Professionals are provided as **Appendix L.**

EDR Aerial Photo Decade Package

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

When delivered electronically by EDR, the aerial photo images included with this report are for ONE TIME USE ONLY. Further reproduction of these aerial photo images is prohibited without permission from EDR. For more information contact your EDR Account Executive.

Thank you for your business.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Report is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Report includes a search of available city directory data at 5 year intervals.

RESEARCH SUMMARY

The following research sources were consulted in the preparation of this report. A check mark indicates where information was identified in the source and provided in this report.

MEMORANDUM

DATE: April 12, 1990

TO: Del Borgsdorf, City Administrator
Mayor Jernigan
City Council Members

FROM: Ron Olson, Superintendent of Parks and Recreation

SUBJECT: Environmental Test results on 415 W. Washington Street site, North Main Garage and Hawkins Property

Attached is the summary section of the above report.

The Garage Committee will review the test results on Wednesday, April 25, 1990 at 7:00PM 2nd Floor Conference Room/Fire Station. A representative from ENCOTEC will be present to discuss the testing and answer questions.

RE: Environmental Property Assessments for Hawkins, 415 W. Washington Street, and Municipal Garage Properties

Dear Ron:

Enclosed are two copies of the Environmental Property Assessment that was done under RFP No. 250. This assessment should provide sufficient data and evaluation to characterize the properties mentioned above. I must personally apologize for the delay in forwarding this report to you as I had hoped to have time to review more pertinent sections with you. This report shows that there may be some areas in need remediation on each of the properties. These areas appear to be localized spills or "hot spots." However, there should be additional sampling and analytical work performed prior to conducting any remedial activities to better delineate the size of these areas and limit the extent of excavation necessary.

If there are any questions or comments, please feel free to contact Randy Ponitz, ENCOTEC Geologist, or myself at your convenience.

Thank you for allowing ENCOTEC the opportunity to serve your environmental needs.

Sincerely,

Douglas L. Humbert
Senior Environmental Scientist

Project No. 79110

City of Ann Arbor
Environmental Property Assessment
26 February, 1990

I INTRODUCTION

Environmental Control Technology Corporation (ENCOTEC), Ann Arbor, Michigan, has been contracted by the City of Ann Arbor Parks and Recreation Department (COAA) to perform an environmental site investigation and assessment which will evaluate and identify any potential contamination from hazardous wastes in soils and waters at certain City of Ann Arbor properties. This assessment was performed on the three properties identified in COAA 6 July, 1989, Request for Proposal No. 250 as amended by 4 August, 1989, Addendum No. 1.

II SCOPE OF PROJECT

The specific goal of this project was to identify site contamination for the following properties identified in COAA Proposal:

A HAWKINS PROPERTY

This property is located off of North Main St. at Lakeshore Drive and the Huron River in Ann Arbor. The property incorporates two parcels that comprise approximately 8 acres of land abutting the Huron River on the East side. The West side is bordered by an active railroad. Current uses of the site include an auto body repair shop, a towing service, a rowing club and an artist's studio. Previously, the western-central portion of this property was leased by Michigan Automotive Research Corp (MARC). This portion of property contained two buildings which MARC used for engine testing. There were 5 underground storage tanks, 4 - 10,000 and 1 - 1,000 gallon, that held gasoline for engine testing. These tanks have been removed since this contract's approval and implementation.

Being a low-lying area, this property has been filled over the years to facilitate continued use during times of flood. The origin of fill material(s) is not known and can be better determined by conducting numerous soil borings at the property. This task will be performed as a portion of this evaluation. It is not suspected however that the fill material(s) would be located below the water table, (probably at or near the elevation of this property's soil surfaces). Should there be any contamination present, the water table should not provide any type of barrier that could prevent migration. Therefore, samples will be taken from the ground water after it is encountered at each boring location.

Additional samples will be taken from the soils adjacent to the railroad to delineate and potentially define contamination from polychlorinated biphenyl compounds (PCB's). These are suspect contaminants from railroad usage and may have been transported onto the site through particulate dispersion. A grid pattern will be developed from existing maps and sampled as specified in ENCOTEC's proposal with one sample being removed from the center of each grid.

B NORTH MAIN STREET MUNICIPAL GARAGE

The Municipal Garage is located at 717 through 725 North Main Street. This property is presently being utilized for vehicle and equipment maintenance, road salt storage, fuel storage, and miscellaneous equipment storage and comprises 5.13 acres. Numerous buildings exist on site including a large COAA maintenance complex and several miscellaneous storage buildings. The property is bordered by North Main St. to the East, an active railroad to the West, residential housing to the south and Summit St. to the north. A single underground storage tank was identified in the property survey. This

tank was reported to contain waste oils. Since the implementation of subsurface investigation and sampling, the tank has been removed. Fuel storage tanks are located above ground with only the dispenser piping traversing the site below soil surfaces. On the east side of this property, adjacent to the railroad, is a spur that was reported by COAA employees to have been a coal unloading station. The northern most section of the property is presently used for parking. The Allen Creek Drain traverses the North Main Street property from the southwest to the northeast.

Surface and sub-surface investigations will be necessary to evaluate potential contamination from fuel spillage, unknown fill materials potentially placed during early years of operation, waste oil from leaking underground storage tanks and leaking dispenser piping for the existing refueling station. Ground water is expected to be encountered for each subsurface investigation borehole. Ground water may be sampled and analyzed to determine if contamination has occurred from any of the potentially identified or other unidentified sources.

C WEST WASHINGTON OFFICE AND MAINTENANCE FACILITY

This property is located at 415 West Washington Street. The property comprises 3.40 acres of land and contains a large building complex with some smaller outlying buildings. This parcel is bordered by West Washington St. to the North, West Liberty St. to the south, an active railroad to the east and residential housing to the west. Property usage includes COAA vehicle maintenance, city sign production and maintenance shop, various departmental offices, and miscellaneous equipment storage. Two existing underground storage tanks were identified on-site. These are both of relatively recent

construction. Two above ground storage tanks were also identified. The first is located on the east property boundary adjacent to West Washington Street and the railroad; the second is located at the east end of north building complex. Both tanks are believed to be empty. The tank attached to the building complex is suspected to once have held fuel oil for building heat systems. No information could be obtained regarding the contents of the other tank.

Interviews with COAA employees revealed that this property once belonged to Washtenaw County. Details of activities conducted by the County were somewhat restricted to information obtained during these interviews. COAA employees stated that this property was utilized as a highway maintenance and engineering facility, similar to present usage.

This site may have been contaminated from refueling activities, sign production and finishing, vehicle and equipment maintenance, pesticide and herbicides used by COAA and Washtenaw County, and leaking underground and above ground storage tanks. A surface and sub-surface soil investigation will be performed in selected areas to determine if contamination has occurred by COAA or Washtenaw County. Additionally, groundwater samples may be taken in select areas suspected of contamination.

III PROCEDURES UTILIZED TO CONDUCT SITE ASSESSMENTS

Based on the information presented within COAA RFP 250, ENCOTEC submitted a general proposal to investigate the above mentioned properties. The intent of this investigation was to identify areas with an associated risk from the improper management of hazardous and toxic materials during past and present property usage. The procedures ENCOTEC utilized for investigative purposes were typical to the

environmental industry for the evaluation of property involved in this type of assessment. An assessment is usually multi-phasic. Each action ends with a decision making step that determines whether to continue further into the investigative process. Although this process incurs more expense (e.g. re-mobilization of drilling crew) should additional sub-surface investigations be necessary subsequent to an initial event, the process is considerably less costly when no contamination is detected.

A SITE VISITATION AND SURVEY

The site visitation is an essential portion of a property assessment to locate areas of potential contamination and better define the assessment process by identifying past and present areas of heavy industrial usage. Within the property survey process the visiting crew typically covers all areas of the property to determine the type of activities for which the property has been used. At a minimum these include: current operating conditions which the owner or tenant is undertaking or has undertaken that could result in the contamination of soils and groundwaters, identifying areas that have been filled and/or areas on which stressed vegetation is obvious, and surveying businesses adjacent to the property were contamination could have migrated on-site. The survey crew will make every attempt to interview employees in order that knowledge of the site history be obtained.

ENCOTEC typically performs site visitations with both the project manager and a geologist. These individuals carefully survey the property to be investigated. Notes are taken with regard to the topography of the site, suspected direction of groundwater flow, obvious indications of soil contamination such as soil staining or stressed vegetation, abandoned drums or other empty hazardous

material containers, locations of underground storage tanks appurtenances and dispensers, areas of equipment storage, equipment maintenance areas, on-site locations of electrical transformers, abandoned batteries and the adjacent properties' usage. During this site visitation, utilities are duly noted as they may affect the sub-surface soil investigations. If personnel are available, interviews will be conducted to better determine activities that have occurred within and adjacent to property boundaries.

Usually, the information obtained within an initial visitation is sufficient to select boring locations. These boring locations are determined while on-site and clearly marked so that the drilling crew and ENCOTEC geologist can relocate the boring points while the investigation is taking place. Should additional information be required prior to selecting boring locations, (e.g. drainage tile locations, abandoned underground storage tanks, property boundaries, etc.), this information will be obtained and the site revisited to select the boring locations.

Once all the necessary information has been obtained from the site visitation and boring locations have been selected, some additional activities must take place prior to conducting the soil borings. First and foremost, a utility locater service must be contacted and a request made for underground utilities locations to be clearly identified at the property undergoing the investigation prior to conducting any soil boring activities. Contractual agreements are made between the drilling contractor and ENCOTEC to conduct soil borings for the days necessary to investigate the property. These contracts typically specify the property locations and dates on which drilling is to be conducted. The drilling contractor is also given specific instructions with

regards to sampling depths and procedures, equipment decontamination, health and safety, and any associated hazards which may be at the site while the investigation is taking place. Finally, ENCOTEC laboratory personnel are contacted through inter-company correspondence and made aware of the date(s) for the incoming samples to expedite the analytical process and data production phase for this type of investigation.

B SUBSURFACE INVESTIGATION AND SAMPLE COLLECTION

1 Soil Sampling

The next phase of a site assessment will normally be subsurface investigation and sample collection. For this investigation, series of bore holes were drilled on each property and subsurface core samples were removed from each bore hole for lithologic logging, VOC field screening and chemical analysis. Soil borings were performed using CME 55 and/or CME 75 truck mounted auger drilling rigs with 4 inch diameter hollow stem augers in 5 foot sections. Core samples were taken from the bore holes in 24 inch sections using split spoon samplers in accordance with ASTM D-1586. Samples were collected at the surface and thereafter at 5 foot depth intervals to a total depth of 20' or until ground water was encountered, whichever occurred first.

For the surface samples, split spoons were driven directly into the surface using a 140 lb. drop hammer. Subsurface sampling requires that the bore hole be advanced to the predetermined depth using hollow stem auger. The drill bit is then removed from the lead auger and withdrawn from the bore hole by hoisting 10 foot sections of drilling rod through the hollow stem of the auger string. The bit is removed from the lead rod and replaced by a split spoon sampler that is then

lowered through the hollow stem of the auger string by connecting successive 10 foot sections of the drilling rod and lowering these to the bottom of the bore hole. When the split spoon contacts the bottom, it is driven into the soil below with a series of repetitive blows from the drop hammer until the predetermined depth has been reached. The split spoon and drilling rod are removed from the hole to recover the sample. Upon recovery the split spoon is opened, the core sample inside visually inspected and logged for lithology, appearance, moisture content and odors by the project geologist.

To guard against cross contamination, all down-hole equipment is steam cleaned between holes. Additionally, all field utensils are scraped clean, rinsed with hexane, washed with lab detergent and rinsed repeatedly with deionized water between samples.

All samples were screened in the field for VOC emissions using a Photovac TIP II photoionization detector. This procedure involves placing the sample in its respective container, sealing the container, and allowing the organic vapor phase to reach equilibrium in the container; this takes approximately 15 minutes. Once equilibrium has been reached, the container lid is lifted in a fashion that minimizes the escape of the soil gases but permits entry of the instrument probe. A reading is taken on the gases contained in the headspace and recorded on the field log.

2 Photovac TIP II

The Photovac TIP II operates on the principle that individual chemical compounds have specific ionization potentials which are measured in electron volts (eV). Most of the atmospheric gases have ionization potentials of 12 eV or greater. The vast majority of

organic compounds, in particular those considered pollutants, have ionization potentials of 10.5 eV or less.

A small internal pump draws air (along with any contaminants) into the ionizations chamber of the TIP. This chamber is flooded with ultraviolet light emitted from a miniature lamp having an energy of 10.6 eV. Atmospheric gases such as nitrogen, oxygen, hydrogen and carbon dioxide have higher ionization energies (i.e. greater than 12 eV) and will not be detected by the TIP. However, the organic compounds, especially pollutants, with ionization potentials below the energy (10.6 eV) of the ultraviolet lamp in the TIP are ionized. Two small electrodes are located inside the ionization chamber, one positive and the other negative. The positive ions are attracted to the negative electrode; the negative ions are attracted to the positive electrode. A very sensitive current measuring circuit, or electrometer, detects these ions and produces a current. This current is in turn used to express "Total Ionizables Present" through the digital readout as they are relative to ambient air.

3 Groundwater Sampling

When bore hole depths are sufficient to reach the water table, groundwater will enter an open hole. Groundwater samples are collected when this condition occurs.

A stainless steel or Teflon(R) bailer is used to collect groundwater samples from the bore hole. These bailers are first washed with a non-phosphate detergent and triple rinsed with deionized water. Sometimes special sampling requirements mandate that additional rinses are necessary with nitric and hydrochloric acids, acetone or methanol and hexane. The clean

bailer is then lowered down the bore hole using clean polypropolene or nylon rope. Upon reaching groundwater, the bailer is submerged and allowed to fill with water. Care is taken not to agitate the groundwater unnecessarily so as to avoid oxygenation to the sample. The first bailer of water is emptied without any sampling. This serves to rinse the bailer. The bailer is lowered down the hole again and filled to begin sampling. Sample containers are filled directly from the bailer.

4 Common Field Practices and Procedures

To protect the sample and maintain sample integrity while minimizing possible cross contamination, numbers' of persons who handle samples in the field are kept to a minimum. Persons handling samples are required to wear clean latex or vinyl gloves. Soil samples are placed in borosilicate glass sample jars with Teflon(R) lined lids. Groundwater samples are placed in 40 mL. borosilicate glass vials with Teflon(R) lined septum tops for VOC analyses. Groundwater samples analyzed for metals content are placed in 1 L polyethylene containers. If groundwater sample filtering is necessary to determine dissolved metals, filtering will be performed in the field or by the laboratory as soon as possible after sampling. All sample containers have been specially cleaned prior to use. This cleaning meets or exceeds US EPA protocols. If new containers are to be used, then these containers are shipped from the factory under chain-of-custody seals and are not opened until the container is to be used for sampling.

All samples requiring refrigeration are promptly placed in ice chests that have been pre-cooled to a temperature of approximately 4°C with ice or "Blue Ice" freeze packs. Strict Chain-of-Custody procedures are

always observed. Chain-of-Custody forms are completed to the fullest extent possible prior to sample transport or shipment to the designated laboratory. These forms include the following information: Person Collecting Sample, Client whose sample was collected, Sample Identification, Time Collected, Source of Sample and Location, Analyses Required, Preservatives, Sample Matrix (e.g. soil, water, sludge, etc.), Receiving Laboratory, and Method of Shipment. The Chain-of-Custody forms are signed to identify the sample collector and to relinquish the sample to the receiving laboratory. At the laboratory receipt of the samples is acknowledged by signature. Should the primary laboratory subcontract any of the analysis to be performed on the sample(s), the Chain-of-Custody record is maintained by each sub-contracting laboratory. In the event of transport by common carrier, the packaging used to ship the samples is sealed with custody seals signed by the person sending the samples. In the event these seals have been broken or tampered with, the receiving laboratory must duly note any breach of custody seal integrity. The Chain-of-Custody forms for COAA site survey samples have been attached as Appendix I.

C ANALYTICAL PARAMETERS

ENCOTEC was contracted by the COAA to perform suitable site characterization for the properties described within this report. Using the soil boring and sampling procedures described above, ENCOTEC has chosen the following analytical parameters to identify any contamination resulting from activities conducted at these three COAA sites.

1 US EPA Method 8010, SW-846. Third Edition.

Method 8010 is a gas chromatographic (GC) analysis that determines the concentrations of certain haloge-

nated volatile organic compounds in water, soil and waste samples. This method requires the gas chromatograph to heat the column sufficiently to separate volatile organic compounds (VOC's) of interest as the sample is carried though the column by helium gas. The VOC's are separated as the sample passes through the column and detected by a electrolytic conductivity detector or halogen specific detector. Results are determined by comparing machine response for sample constituents, if any, to calibration reference standards that contain compounds of interest run on the same machine under the same operating conditions.

This list of compounds from Method 8010 are of particular interest in evaluating the COAA properties. These are common to degreasing solvents and other industrial chemicals that may have been used in previous years of operation.

Carbon tetrachloride	Cis-1,2-dichloroethene
Chlorobenzene	1,2-Dichloropropane
1,2-Dichlorobenzene	Cis-1,3-dichloropropene
1,3-Dichlorobenzene	Trans-1,3-dichloropropene
1,4-Dichlorobenzene	Methylene Chloride
1,1-Dichlorethane	1,1,1-Trichlorethane
1,2-Dichloroethane	1,1,2-Trichloroethane
Trans-1,2-dichloroethene	Trichloroethene

2 US EPA Method 8020, SW-846. Third Edition.

Method 8020 is a gas chromatographic (GC) analysis that determines the concentrations of certain aromatic volatile organic compounds in water, soil and waste samples. This method requires the gas chromatograph to heat the column sufficiently to separate volatile organic compounds (VOC's) of interest as the sample is carried though the column by helium gas. The VOC's are separated as the sample passes through the column and

detected by a photoionization detector (PID). Results are determined by comparing machine response for sample constituents, if any, to calibration reference standards that contain compounds of interest run on the same machine under the same operating conditions.

This list of compounds from Method 8020 are of particular interest in evaluating the COAA properties. The non-chlorinated compounds listed below are common to paints and petroleum compounds including automotive fuels. Chlorinated aromatic VOC's may be associated with certain pesticide and herbicide breakdown products or result directly from the formulation of these chemicals.

Benzene
Chlorobenzene
1,2-Dichlorobenzene
1,3-Dichlorobenzene
1,4-Dichlorobenzene
Ethyl Benzene
Toluene
Xylenes

3 MICHIGAN ACT 64 METALS

Act 64 contains the rules and regulations governing Michigan's hazardous waste, hazardous waste generators and disposal facilities. There are 10 metals identified as potentially hazardous under these laws: Arsenic, Barium, Cadmium, Chromium, Copper, Lead, Mercury, Selenium, Silver and Zinc. Accordingly, these metals have been selected to determine whether any characteristic wastes, (i.e. those with any of the 10 potentially leachable metals at or above regulatory action levels), have contaminated surface or subsurface soils and the groundwaters underlying COAA properties investigated in this assessment.

These 10 metals are common to most all industrial activities. Heavy metals are used in plating and metal finishing processes, in various metal alloys, and as

pigment compounds for paints and dyes. They are also used as wear reducing agents in fuels and lubricating oils, and in the power generating cells of industrial batteries. Contamination from heavy metals may be present at the three COAA properties from any or all of the above mentioned industrial applications.

Soil boring samples and groundwaters will be sampled and analyzed for the 10 Michigan Act 64 metals using the following methodologies. For metals barium, cadmium, chromium, copper, lead and zinc, SW-846 Method 6010 will be utilized. Arsenic and selenium will be analyzed using Methods 7061 and 7741, respectively. Mercury analysis is performed using Method 7470 for groundwaters and Method 7471 for soil boring samples.

4 POLYCHLORINATED BIPHENYL COMPOUNDS (PCB'S)

PCB's are regulated under the Toxic Substance Control Act (TSCA) of 1976 and its subsequent reauthorizations. Strict clean-up standards were placed into effect for areas where spills were known to have occurred and for areas of incidental PCB contamination. Samples will be taken to verify that none of the common forms of PCB's have contaminated the Hawkin's Property site. The analyses will conform to methodology described in SW-846 Method 8080. In the event that significant PCB's are discovered on this site, resampling and further characterization will be necessary to delineate the extent of contamination.

IV ASSESSMENT RESULTS AND DISCUSSION

Generally, analytical results reveal the properties to be relatively free of contamination with the exception of a few areas. Survey results showed little or no contamination in the majority of samples taken at all three of the COAA properties. Property assessments indicated little that could be considered indicative of contamination. Vegetation

appeared healthy and unstressed regardless of the activities ongoing at each site. Some surface soil staining was obvious, but not unexpected considering the number of vehicles and ongoing maintenance operations being performed. This was anticipated when considering past property usage. Analytical results reveal other areas of contamination that indicate potential spillage or inadvertent discharge of common industrial materials has occurred. Certain analyses show levels of some contamination above those that would be considered a site specific background level. The contaminates most obvious are the heavy metals, although trace levels of organics were detected in certain areas. These contaminates most likely include paints and fuels which were discharged to the surface soils.

A HAWKINS PROPERTY

The investigation of the Hawkins property was expanded over the other two properties due to the size of the site and the lack of knowledge regarding past activities that took occurred. Delays were encountered in gaining access to the property from its current owner. The property visitation was initially conducted in November, 1989. However, ENCOTEC was requested to leave the premises prior to survey completion. Approval was finally obtained on 28 November, 1989 per Ron Olson transmittal for Hawkins property access. Surface and sub-surface investigations took place on 4, 5 and 6 January, 1990.

1 GEOLOGICAL EVALUATION - HAWKINS PROPERTY

Eight exploratory soil borings were cored to a total depth of 20.5 feet below ground level on the Hawkins property. Boring logs have been included in this report as Appendix II. Subsurface soil conditions at the Hawkins property show some variability with depth. In general soils are predominantly sand and clay with minor inclusions of gravel and silt. In most

soil borings the uppermost two to three feet were composed of fine to coarse sand, fine to medium gravel and topsoil or mixed sand, gravel and topsoil with brick and concrete rubble. The source of the fill material is not known although expected in this low-lying area. A fine to medium sand was typically present below the fill to a depth of approximately six to ten feet below ground level. A sandy and/or silty clay was encountered below this sand in most cases. This usually extended beyond termination depth.

The Photovac TIP II(R) headspace reading were taken on all core samples collected. Overall, soil headspace readings were near background levels. The highest reading observed in the Hawkins property borings was 22.0ppm (H-1, 9.5-11ft.) and the lowest was 0.0 (H-2, 19-20.5ft.).

Groundwater was generally encountered at depths three to seven feet below surface level. All soil borings on the Hawkins property produced medium to heavy volumes of groundwater except H-6. Here groundwater volumes varied from light to heavy.

According to the Soil Survey of Washtenaw County, soil at the Hawkins site is described as Wasepi sandy loam (WaA). This soil has low available water capacity, slow to very slow runoff and moderately rapid permeability.

2 ANALYTICAL DATA INTERPRETATION

Appendix III contains the analytical data for Hawkins' Property surface and subsurface soil borings. Cluster charts have been prepared and attached as Appendix IV for inorganic parameters analyzed within the scope of this project. These specifically represent metals data in relation to a basic statistical

format of mean and a three sigma upper control limit specific to the soils of this particular site. The upper control or 3 sigma line is simply the mean for a particular parameter added to three times the standard deviation. In most remedial actions this type of basic statistical analyses determines clean levels of soil and areas of exceedance that are suspect to contamination. For comparison purposes ENCOTEC elected to use the Michigan Department of Natural Resources' "Michigan Background Soil Survey", compiled by the MDNR Waste Management Division, attached as Appendix V. It appears that the higher metals concentrations reside in upper elevations for the COAA assessment borings. Therefore, ENCOTEC chose the n-Saginaw topsoil results to do this comparison.

Groundwaters show no significant contamination by organic compounds. The only detectable contaminants were those common to all analytical laboratories. Metals analysis indicated only trace levels of heavy metals thus suggesting the groundwaters at the water table is relatively clean.

a Organics Data

Analysis of Hawkins property data show no specific organics contaminating the site at any significant concentrations within the list of compound that were screened.

i Soils

Samples taken from Hawkin's property soils show indication of past and present industrial activities. Debris and fill are duly noted over the entire property. Soil staining is obvious in areas surrounding buildings and in the vehicle yards and parking areas. Soils around the underground stor-

age tanks were stockpiled after removal, awaiting analyses. However, no organic compounds were detected at specific 8010 and 8020 detection levels. TIP II readings (discussed above) indicate light hydrocarbon (C9-C12) fractions may be present in bore samples taken around the underground storage tanks. However, these were not analyzed for nor specified in the proposal. Analytical data for Hawkins' site soil borings has been attached as Appendix III.

ii Groundwaters

Methylene chloride was evident in only one sample. This is common laboratory extraction solvent and routinely found in both method blanks and samples analyzed for volatile organic compounds. All other compounds were below the analytical detection limit.

b Metals Data

i Soil Borings

Heavy metals occur naturally in all soils. ENCOTEC believes that the existence of these metals in soils does not automatically indicate a contaminated site. Therefore, each heavy metal is addressed individually regarding its natural existence as opposed to being a site contaminant when that metal occurs above the analytical detection limit. This task is completed using the cluster chart mean and 3 sigma values specific to each analyses as discussed above.

Inorganic analyses reveal this site to relatively clean and free of heavy metals contamination when compared to Appendix V, "Michigan Background Soil Survey."

aa - The MDNR soil survey indicates arsenic at a typical concentration of 3.8 mG/kG. The average for the Hawkins Property was only 3.2 mG/kG. However, the MDNR soil survey standard deviation differed from that of the Hawkins Property by an additional 1.1. This would be expected in a site specific survey.

bb - Barium analyses revealed a mean of 57mG/kG with a standard deviation of 9.9 for the Hawkins property. This compares favorably to the MDNR Soil Survey at 41mG/kG and standard deviation values of 8.7.

cc - Cadmium measured 0.94 mG/kG with a standard deviation of 0.37. The MDNR Soil Survey indicates 1.0 mG/kG as typical background concentration with no standard deviation. Statistical results of this type suggest that the analytical result, 1.0mG/kG, was also the analytical detection limit for the MDNR survey.

dd - Chromium measured an average of 8.7 mG/kG with a standard deviation of 3.6 at the Hawkins site. The MDNR survey reveals typical background concentration for chromium at 12.4 with a standard deviation of 4.1.

ee - Hawkins Property copper concentrations were determined to be slightly higher than those of the MDNR Soil Survey. The total copper analytical mean was 21mG/kG with a standard deviation of 18 where as the MDNR soil survey reported typical copper concentrations at

11.6mG/kG with a standard deviation of 3.4. One sample, H-6 0-2ft., exceeded all other samples concentrations by almost an order of magnitude.

ff - Lead concentrations at the Hawkins site showed significantly higher concentration and variability than those reported in the MDNR Soil Survey. Hawkins Property soils samples measured between 5mG/kG and 350mG/kG for total lead concentrations. The majority were at or below 40 mG/kG. Those samples measuring above 40mG/kG are suspect site contaminates.

gg - Mercury concentrations in Hawkins' Property soils reveals a variability due to extreme outliers of two samples. The mean for mercury at the Hawkins site was determined to be 0.13mG/kG with a standard deviation of 0.21 as compared to the MDNR Soil Survey typical concentration of 0.11 with a standard deviation of 0.16. This comparison is misleading because five of the mercury values in this assessment were assumed to be the analytical detection limit and included on the cluster charts for graphical purposes. ENCOTEC believes this situation also applies to the mercury data present in the MDNR Soil Survey when considering the low average concentration and relatively high standard deviation. The Hawkins site samples H-2 0-2ft. and H-3 0-2ft. mercury results' are significantly higher than others sampled and analyzed at that location. These areas require further investigation as mercury contamination may be present.

hh - Selenium analysis shows acceptable concentrations when compared to MDNR Soil Survey typical concentrations. Soil samples from the Hawkins site show selenium concentrations to range from the analytical detection limit to 0.31mG/kG with a mean concentration of 0.12mG/kG and a standard deviation of .08. The MDNR Soil Survey reports typical selenium concentrations at 0.28mG/kG with a 0.09 standard deviation.

ii - Analysis for silver revealed concentrations below the analytical detection limit for almost all samples. Those samples with detectable silver barely exceeded the analytical detection limit. Therefore, further silver evaluation and discussion is not warranted.

jj - Statistics for zinc concentrations at the Hawkins site are biased by a single outlying sample, H-8 0-2ft., having a concentration of 141mG/kG. Zinc concentrations in soils at the Hawkins site range between 22 and 141mG/kG with a mean of 58mG/kG and a standard deviation of 27. Typical background soils concentrations as reported in the MDNR Soil Survey have a mean of 39mG/kG with a standard deviation of 19. The majority of the Hawkins property samples have concentrations less than 75mG/kG. The surface soils around H-8 may be suspect of zinc contamination and merit additional investigation.

ii Groundwaters

Groundwater samples taken for metals analysis were total metals samples. A total groundwater metal analysis includes any silts and sediments

that may be removed with the sample from the bore hole by the bailer. Therefore, some metals are resultantly reported above the analytical detection limit.

aa - Arsenic values for Hawkins site groundwaters range from the analytical detection limit to 0.046mG/L.

bb - Barium values for Hawkins site groundwaters range from 1.7 to 5.9mG/L.

cc - Cadmium values for Hawkins site groundwaters range from the analytical detection limit to 0.028mG/L.

dd - Chromium values for Hawkins site groundwaters range from the analytical detection limit to 0.28mG/L.

ee - Copper values for Hawkins site groundwaters range from 0.12 to 0.58mG/L.

ff - Lead values for Hawkins site groundwaters range from the analytical detection limit to 0.39mG/L.

gg - Mercury values for Hawkins site groundwaters were below the analytical detection limit.

hh - Selenium values for Hawkins site groundwaters range from the analytical detection limit to 0.012mG/L.

ii - Silver values for Hawkins site groundwaters were below the analytical detection limit.

jj - Zinc values for Hawkins site groundwaters range from 0.10 to 1.4mG/L.

c PCB's

Of the 10 surface soils sampled for PCB's, none contained measurable PCB's at 1part per million. See data attached as Appendix VI.

B NORTH MAIN STREET MUNICIPAL GARAGE

The investigation of the North Main Street Municipal Garage initiated with a site visitation on 12 October, 1989. Surface and sub-surface investigations took place on 16 and 20 October, 1989.

1 GEOLOGICAL EVALUATION - MUNICIPAL GARAGE

Four exploratory soil borings were drilled to a total depth of 20.5 feet below ground level at the Municipal Garage. Boring logs have been included in this report as Appendix VII. Subsurface soil conditions at the Municipal Garage site show only minor variations with depth. Soils are composed predominantly of fine and coarse sand and clayey sand with minor inclusions of fine to medium gravel. Heterogeneous composition of the uppermost four to five feet suggests that this material is fill. The source of the fill material is not known. Thin layers of silt are penetrated in soil borings NM-1 (18.5-20.5ft) and NM-3 (14.5-17.5ft). A silty clay was encountered in NM-3 (17.5-20.5ft).

The Photovac TIP II(R) headspace reading were taken on all core samples collected. Overall, soil headspace readings were near background levels. The highest readings were observed in the Municipal Garage property boring NM-1. These readings ranged from a low of 4.0ppm, NM-1 (19-20.5ft), and a high of 48ppm, NM-1 (4.0-6.0ft).

Groundwater was generally encountered at three feet below surface level in borings NM-1 and NM-3 and 6.8 feet in boring NM-4. Boring NM-2 did not encounter ground water although some water intrusion occurred at the bore hole depth of 20.5 feet to permit sampling and analysis.

According to the Soil Survey of Washtenaw County, soil at the Municipal Garage site is described as Fox sandy loam. This soil has moderate available water capacity, slow runoff and moderate permeability.

2 ANALYTICAL DATA INTERPRETATION

Appendix VIII contains the analytical data for Municipal Garage surface and subsurface soil borings. Cluster charts have been prepared and attached as Appendix IX for inorganic parameters analyzed within the scope of this project. These specifically represent metals data in relation to a basic statistical format of mean and a three sigma upper control limit specific to the soils of this particular site. In most remedial actions this type of basic statistical analyses determines clean levels of soil and areas of exceedance that are suspect to contamination. For comparison purposes ENCOTEC elected to use the Michigan Department of Natural Resources' "Michigan Background Soil Survey", compiled by the MDNR Waste Management Division, attached as Appendix V. It appears that the higher metals concentrations reside in upper elevations for the COAA assessment borings. Therefore, ENCOTEC chose the n-Saginaw topsoil results to do this comparison.

Groundwaters show no significant contamination by organic compounds. The only detectable contaminants were those common to ENCOTEC's analytical laboratories

during the time of analysis. Metals analysis indicated only trace levels of heavy metals thus suggesting the groundwater at the water table is relatively clean.

a Organics Data

Analysis of Municipal Garage data show no specific organics contaminating the site at any significant concentrations within the list of compound that were screened.

i Soils

Samples taken from Municipal Garage soils show indication of past and present industrial activities. Debris and fill are duly noted over the entire property. Soil staining is obvious in areas surrounding buildings and in the vehicle yards and parking areas. No organic compounds were detected at specific 8010 and 8020 detection levels. TIP II readings (discussed above) indicate light hydrocarbon (C9-C12) fractions may be present in bore samples taken from NM-1. However, these compounds were not analyzed for nor specified in the proposal. Data for Municipal Garage soil borings has been attached as Appendix VIII.

ii Groundwaters

Methylene chloride was evident in several samples. This is common laboratory extraction solvent and routinely found in both method blanks and samples analyzed for volatile organic compounds. Toluene was also detected but not quantified due to laboratory contaminants related to ENCOTEC construction activities. All other compounds were below analytical detection limits.

b Metals Data

i Soil Borings

Heavy metals occur naturally in all soils. ENCOTEC believes that the existence of these metals in soils does not automatically indicate a contaminated site. Therefore, each heavy metal is addressed individually regarding its natural existence as opposed to being a site contaminant when that metal occurs above the analytical detection limit. This task is completed using the cluster chart mean and 3 sigma values specific to each analyses as discussed above.

Inorganic analyses reveal this site to relatively clean and free of heavy metals contamination when compared to Appendix V, "Michigan Background Soil Survey."

aa - The MDNR soil survey indicates arsenic at a typical concentration of 3.8mG/kG. The average for this property was only 2.8mG/kG. However, the MDNR soil survey standard deviation, 0.8, differed from that of the Municipal Garage by an additional 1.3. This would be expected in a site specific survey.

bb - Barium analyses revealed a mean of 66mG/kG with a standard deviation of 28 for the Municipal Garage property. If the 129 and 85mG/kG results from borings NM-1 5-7ft and NM-3 0-2ft were excluded, the other analyses would compare favorably to the MDNR Soil Survey at 41mG/kG and a standard deviation value of 8.7.

cc - Cadmium measured an average of 0.35 mG/kG with a standard deviation of 0.17. The MDNR Soil Survey indicates 1.0 mG/kG as typical background concentration with no standard deviation. Statistical results of this type suggest that the analytical result, 1.0mG/kG, was also the analytical detection limit for the MDNR survey.

dd - Chromium measured an average of 7.1 mG/kG with a standard deviation of 3.1 at the Municipal garage. The MDNR survey reveals typical background concentration for chromium at 12.4 with a standard deviation of 4.1.

ee - Copper concentrations were comparable to those of the MDNR Soil Survey. The Municipal Garage copper analytical mean was 16mG/kG with a standard deviation of 9 where as the MDNR soil survey reported typical copper concentrations at 11.6mG/kG with a standard deviation of 3.4.

ff - Lead concentrations at the Municipal Garage showed significantly higher concentration and variability than those reported in the MDNR Soil Survey. Soil samples measured between 9.8 and 163mG/kG for total lead concentrations. The majority were at or below 30mG/kG. Those samples measuring above 40mG/kG are suspect site contaminates.

gg - Mercury concentrations in soils reveals little variability. The mean for mercury at the Municipal Garage was determined to be 0.04mG/kG with a standard deviation of 0.019 as compared to the MDNR Soil Survey typical concentration of 0.11 with a standard deviation of 0.16.

hh - Selenium analysis shows acceptable concentrations when compared to MDNR Soil Survey typical concentrations. Soil samples show selenium concentrations to range from the analytical detection limit to 1.4mG/kG with a mean concentration of 0.26mG/kG and a standard deviation of 0.46. The MDNR Soil Survey reports typical selenium concentrations at 0.28mG/kG with a 0.09 standard deviation. The 1.4mG/kG sample, NM-1 5-7ft, also contained other elevated metals results and suspected to be contaminated.

ii - Analysis for silver revealed concentrations below the analytical detection limit for almost all samples. Those samples with detectable silver barely exceeded the analytical detection limit. Therefore, further silver evaluation and discussion is not warranted.

jj - Zinc concentrations in soils at the site range between 31 and 92mG/kG with a mean of 56mG/kG and a standard deviation of 19. Typical background soils concentrations as reported in the MDNR Soil Survey have a mean of 39mG/kG with a standard deviation of 19.

ii Groundwaters

Groundwater samples taken for metals analysis were total metals samples. A total groundwater metal analysis includes the silts and sediments that may be removed with the sample from the bore hole by the bailer. Therefore, some metals are resultantly reported above the analytical detection limit.

aa - Arsenic values for this site's groundwaters range from the analytical detection limit to 0.052mG/L.

bb - Barium values for This site's groundwaters range from 2.9 to 5.2mG/L.

cc - Cadmium values for this site's groundwaters range from the analytical detection limit to 0.028mG/L.

dd - Chromium values for this site's groundwaters range from the analytical detection limit to 0.14mG/L.

ee - Copper values for this site's groundwaters range from 0.16 to 1.4mG/L.

ff - Lead values for this site's groundwaters range from 0.03 to 1.3mG/L.

gg - Mercury values for this site's groundwaters were below the analytical detection limit.

hh - Selenium values for this site's groundwaters range from the analytical detection limit to 0.012mG/L.

ii - Silver values for this site's groundwaters were below the analytical detection limit.

jj - Zinc values for this site's groundwaters range from 1.0 to 4.0mG/L.

c Total Petroleum Hydrocarbons

Per verbal request by COAA Risk Manager, total petroleum hydrocarbon samples were analyzed for borings NM-4 5-7 and NM-4 15-17 to identify potential UST leakage. When compared to standards issued by the Michigan State Fire Marshall's office for UST

remediations, these total petroleum hydrocarbon analyses exceed the 100ppm standard. The underground waste oil storage tank just to the west of boring NM-4 is suspect of leakage. See data attached as Appendix X.

C WEST WASHINGTON ST. OFFICES AND MAINTENANCE

The investigation of the North Main Street Municipal Garage initiated with a site visitation on 12 October, 1989. Surface and sub-surface investigations took place on 13 October, 1989.

1 GEOLOGICAL EVALUATION - WASHINGTON STREET

Four exploratory soil borings were drilled to a total depth of 20.5 feet below ground level at the Municipal Garage. Boring logs have been included in this report as Appendix XI. Subsurface soil conditions at the Washington Street site show little variation with depth. Soils are composed predominantly of fine and coarse sand with minor inclusions of fine to medium gravel. In most cases the upper 5 to 10 feet appeared to be highly heterogeneous suggesting that this material is fill. The source of the fill material is not known.

The Photovac TIP II(R) headspace reading were taken on all core samples collected. Overall, soil headspace readings were near background levels. However, somewhat elevated readings were observed at soil boring W-2 in the core sample recovered from the 10ft. depth interval. A significant oil and/or solvent odor was noted on the sample bore log along with significant soil staining.

Groundwater was generally encountered seven feet below surface level in all borings except W-4 where it

was encountered at 14.5ft. This corresponds to the location of the bore hole and the higher elevation of ground level.

According to the Soil Survey of Washtenaw County, soil at the Washington Street site is described as Matherton sandy loam (MdA). This soil has moderate available water capacity, slow to very slow runoff and moderate to rapid permeability.

2 ANALYTICAL DATA INTERPRETATION

Appendix XII contains the analytical data for Municipal Garage surface and subsurface soil borings. Cluster charts have been prepared and attached as Appendix XIII for inorganic parameters analyzed within the scope of this project. These specifically represent metals data in relation to a basic statistical format of mean and a three sigma upper control limit specific to the soils of this particular site. In most remedial actions this type of basic statistical analyses determines clean levels of soil and areas of exceedance that are suspect to contamination. For comparison purposes ENCOTEC elected to use the Michigan Department of Natural Resources' "Michigan Background Soil Survey", compiled by the MDNR Waste Management Division, attached as Appendix V. It appears that the higher metals concentrations reside in upper elevations for the COAA assessment borings. Therefore, ENCOTEC chose the n-Saginaw topsoil results to do this comparison.

Groundwaters show no significant contamination by organic compounds. The only detectable contaminants were those common to ENCOTEC's analytical laboratories during the time of analysis. Metals analysis indicated only trace levels of heavy metals thus suggesting the groundwaters at the water table is relatively clean.

a Organics Data

Analysis of Washington Street data show no specific organics contaminating the site at any significant concentrations within the list of compound that were screened.

i Soils

Samples taken from Municipal Garage soils show indication of past and present industrial activities. Debris and fill are duly noted over the entire property. Soil staining is obvious in areas surrounding buildings and in the vehicle yards and parking areas. No organic compounds were detected at specific 8010 and 8020 detection levels. TIP II readings (discussed above) indicate light hydrocarbon (C9-C12) fractions may be present in bore samples taken from W-2. However, these compounds were not analyzed for nor specified in the proposal. Chlorinated solvents were also detected in borings W-4 0-2ft and W-4 10-12ft. However, these were not quantified due to air contaminants occurring in the ENCOTEC laboratory and probably related to laboratory construction activities. Data for Washington Street soil borings has been attached as Appendix XII. No sample was obtained for boring W-2 0-2ft because a brick plugged the split spoon sampler opening.

ii Groundwaters

Methylene chloride was evident in several samples. This is common laboratory extraction solvent and routinely found in both method blanks and samples analyzed for volatile organic compounds. All other compounds were below analytical detection

limits. Analyses for Method 8010 and 8020 were not done on groundwater samples from W-4 due to sampling difficulties.

b Metals Data

i Soil Borings

Heavy metals occur naturally in all soils. ENCOTEC believes that the existence of these metals in soils does not automatically indicate a contaminated site. Therefore, each heavy metal is addressed individually regarding its natural existence as opposed to being a site contaminant when that metal occurs above the analytical detection limit. This task is completed using the cluster chart mean and 3 sigma values specific to each analyses as discussed above.

Inorganic analyses reveal this site to relatively clean and free of heavy metals contamination when compared to Appendix V, "Michigan Background Soil Survey."

aa - The MDNR soil survey indicates arsenic at a typical concentration of 3.8mG/kG. The average for this property was only 2.4mG/kG. However, the MDNR soil survey standard deviation, 0.8, differed from that of the Washington Street site by an additional 2.8. This can be attributed to boring W-2 5-7ft which had a reported 12mG/kG for total arsenic. This layer indicates potential contamination as is indicated by the other metals analyses.

bb - Barium analyses revealed a mean of 70mG/kG with a standard deviation of 55 for the Municipal Garage property. If the 211mG/kG

results from borings W-2 5-7ft and W-2 10-12ft were excluded, the other analyses would compare favorably to the MDNR Soil Survey at 41mG/kG and a standard deviation value of 8.7.

cc - Cadmium measured an average of 0.67mG/kG with a standard deviation of 0.90. The MDNR Soil Survey indicates 1.0 mG/kG as typical background concentration with no standard deviation. Statistical results of this type suggest that the analytical result, 1.0mG/kG, was also the analytical detection limit for the MDNR survey. Sample W-3 0-2 feet yielded a statistical outlier with a reported result of 3.0mG/kG.

dd - Chromium measured an average of 7.1 mG/kG with a standard deviation of 4.2 at Washington Street site. The MDNR survey reveals typical background concentration for chromium at 12.4 with a standard deviation of 4.1.

ee - Copper concentrations were biased by a single outlier at boring W-2 5-7ft. Washington Street samples ranged from 7.6 to 348mG/kG. The MDNR soil survey reported typical copper concentrations at 11.6mG/kG with a standard deviation of 3.4. Copper is a suspect contaminant at boring W-2.

ff - Lead concentrations at showed significantly higher concentration and variability than those reported in the MDNR Soil Survey. Soil samples measured between 7.7 and 348mG/kG for total lead concentrations. Many of these samples were above 40mG/kG. Lead is a suspect site contaminate as it was very common to paints, automotive fuels and lubricants.

gg - Mercury concentrations in soils reveals some variability. The mean for mercury at the Municipal Garage was determined to be 0.10mG/kG with a standard deviation of 0.17 as compared to the MDNR Soil Survey typical concentration of 0.11 with a standard deviation of 0.16. One outlier occurred at W-2 5-7ft with reported result of .51mG/kG.

hh - Selenium analysis shows acceptable concentrations when compared to MDNR Soil Survey typical concentrations for most of the samples taken from Washington Street. These samples show selenium concentrations to range from the analytical detection limit to 1.1mG/kG with a mean concentration of 0.21mG/kG and a standard deviation of 0.35. The MDNR Soil Survey reports typical selenium concentrations at 0.28mG/kG with a 0.09 standard deviation. The 1.1mG/kG sample, W-2 5-7ft, also contained other elevated metals results and suspected to be contaminated.

ii - Analysis for silver revealed concentrations below the analytical detection limit for almost all samples. Those samples with detectable silver barely exceeded the analytical detection limit. Therefore, further silver evaluation and discussion is not warranted.

jj - Zinc concentrations in soils at the site range between 31 and 307mG/kG with a mean of 96mG/kG and a standard deviation of 97. Typical background soils concentrations as reported in the MDNR Soil Survey have a mean of 39mG/kG with a standard deviation of 19. Outliers occurred at borings W-2 and W-3 that severely impact the mean and standard deviation for zinc.

ii Groundwaters

Groundwater samples taken for metals analysis were total metals samples. A total groundwater metal analysis includes any silts and sediments that may be removed with the sample from the bore hole by the bailer. Therefore, some metals are resultantly reported above the analytical detection limit. Metals' analysis for boring W-1 and W-4 groundwaters' is not reported due to sampling difficulties.

aa - Arsenic values for this site's groundwaters range from 0.043mg/L to 0.048mG/L.

bb - Barium values for This site's groundwaters range from 3.5 to 5.7mG/L.

cc - Cadmium values for this site's groundwaters range from 0.053 to 0.092mG/L.

dd - Chromium values for this site's groundwaters range from 0.40mG/l to 0.75mG/L.

ee - Copper values for this site's groundwaters range from 0.99 to 2.6mG/L.

ff - Lead values for this site's groundwaters range from 5.4 to 5.8mG/L.

gg - Mercury values for this site's groundwaters range from 0.0015 to 0.0020mG/L.

hh - Selenium values for this site's groundwaters range from 0.003 to 0.009mG/L.

ii - Silver values for this site's groundwaters range from below the analytical detection limit to 0.01mG/l, the analytical detection limit.

jj - Zinc values for this site's groundwaters range from 5.4 to 11mG/L.

V CONCLUSIONS

The evaluation of all data and data summaries submitted with this assessment reveals that limited contamination has occurred at the properties assessed within this survey. The most prevalent form of contamination for these properties appears to be heavy metals. These metals are common to paints, fuels and lubricating compounds that may have been spilled or improperly disposed over the years of municipal and industrial use. Also qualitatively identified but not quantified were petroleum hydrocarbons in the soils at all three sites. Some contamination was anticipated considering past and present usage of these properties. Underground storage tanks were present at all three sites. Only vague information could be obtained regarding the contents, operation and maintenance of these tanks. Most older storage tanks are suspect to leakage under these conditions.

Certain remedial activities may be necessary depending on the future intended use of these locations. ENCOTEC advises that further investigation be done before any remediation is performed. The following are tables of areas suspect to contamination and the contaminants believed present:

A HAWKINS' PROPERTY

SAMPLE LOCATION	SUSPECT CONTAMINANT
H-1 0-2ft	Total petroleum hydrocarbons, not quantified
H-1 5-7ft	Total petroleum hydrocarbons, not quantified
H-2 0-2ft	Mercury, 0.84mG/kG
H-6 0-2ft	Total Petroleum Hydrocarbons, not quantified; Copper, 75mG/kG; Lead, 366mG/kG
H-8 0-2ft	Zinc, 141mG/kG

B NORTH MAIN STREET MUNICIPAL GARAGE

SAMPLE LOCATION	SUSPECT CONTAMINANT
NM-1 0-2ft	Total Petroleum Hydrocarbons, not quantified
NM-1 5-7ft	Total Petroleum Hydrocarbons, not quantified; Barium, 129mG/kG; Selenium, 1.4mG/kG; Zinc, 92mG/kG
NM-3 0-2ft	Lead, 163mG/kG
NM-3 5-7ft	Lead, 42mG/kG
NM-4 5-7ft	Total Petroleum Hydrocarbons, 186mG/kG
NM-4 15-17ft	Total Petroleum Hydrocarbons, 225mG/kG

C WASHINGTON STREET SIGN SHOP, MAINTENANCE FACILITY AND OFFICES

SAMPLE LOCATION	SUSPECT CONTAMINANT
W-1 0-2ft	Mercury, 0.24mG/kG
W-2 5-7ft	Total Petroleum Hydrocarbons, not quantified; Arsenic, 12mG/kG; Barium, 211mG/kG; Copper, 348mG/kG; Lead, 228mG/kG; Mercury 0.51mG/kG; Selenium, 1.1mG/kG; Zinc, 307mG/kG
W-2 10-12ft	Total Petroleum Hydrocarbons, not quantified; Lead, 71mG/kG
W-3 0-2ft	Cadmium, 3.0mG/kG; Zinc, 215mG/kG
W-3 5-7ft	Lead, 113mG/kG

VI RECOMMENDATIONS

Although some soil contamination is evident, if remediated these soils probably would not be determined characteristically hazardous under Michigan Act 64 Regulations. There exist a few "hot spots" that have been located by this assessment. COAA has several options depending on future intended usage of these properties.

"Hot spots" contaminated with heavy metals and converted to residential or recreational areas should be remediated to eliminate the potential for incidental contact with the soils having these elevated metals. Estimation of necessary remediation costs and activities can only be determined by

performing sufficient additional sampling and analysis, adequate to define boundaries of contamination. Excavated soils would most likely be disposed in a sanitary landfill as it is doubtful that these soils have any hazardous characteristics associated with them under current hazardous waste regulations. Project costs would include additional sampling and analysis, preparation of detailed engineering drawings, excavation and removal contracts, contaminated soil disposal, and excavation backfilling.

Since no listed hazardous wastes were known to be generated or managed on these properties, there are no Act 64 Closure Standards to be met. Therefore, if the areas remain industrial, the soils contaminated with heavy metals could remain in place. This is not advisable, however, as there may be some long term liability associated with these actions depending on current and future statutes implemented by the State of Michigan. The cost of this scenario can not be estimated.

As an alternative to remediating these sites, a risk, based assessment could be performed to determine any associated hazards to human health and the environment. Risk assessments measure associated hazards at a site by looking at potential pathways for migration of contamination offsite when transported by air, surface water, or ground water and may also include risk factors associated with incidental contact. Values are assigned to each aspect of the risk evaluation. These values are entered into a computer model which assesses the site and determines the associated risk by the number of increased cases of cancer to humans and any potential negative impact to the environment. The cost of performing a risk assessment is usually site specific and can be high depending on the level of certainty required.

The underground storage tanks suspected of leaking must be remediated as mandated in Act 478 and amended by Act 150. Simply stated, the underground storage tank, free product from the tank that is uncovered in the excavation, contaminated soils and all appurtenances must be removed and properly disposed of. Clean-up recommendations have been assembled by MDNR and The Department of State Police, Fire Marshall's Division. Although these standards are published as draft guidance, enforcement will most likely be strictly interpreted to these standards as published. Costs of implementing these remediations can be controlled but not limited depending on the length of time the tank was leaking and quantity of tank contents released to the environment.

RE: Parks and Recreation Garage
Remediation Systems Operation and Maintenance Progress Report

Dear Ms. Rolla:

This is NTH Consultants, Ltd. (NTH) fifth progress report on the operation and maintenance of the remediation system at the Parks and Recreation Garage (NTH Project No. 13-501A), located at 415 West Washington Street. The progress report describes system operation and maintenance for the site from August 1, 2000 to January 31, 2001.

Routine Operation and Maintenance

In accordance with the monitoring requirements provided in the National Pollutant Discharge Elimination System (NPDES) General Permit No. MIG080000 and Certificate of Coverage MIG080506 for the Parks and Recreation Garage we have been performing routine site visits typically at a frequency of three visits per week. We also modified the system to increase the influence of the capture zone to effectively reduce the BTEX and PNA concentrations at MW-6.

The routine site visits consisted of a visual inspection, routine maintenance of equipment, sampling of the vapor stream at several locations with a photo ionization detector (PID), collection of water samples, and documentation of the remediation and treatment system performance. The specific dates on which the routine site visits occurred for each month are noted on the attached copies from the monthly data sheets for the site in Appendix B.

To increase the influence of the capture zone in the area of MW-6, the de-watering lines from well nos. 1, 2, and 3 were re-routed. The original system consisted of three1-inch diameter PVC lines leading from the wells into a single line extending to the treatment system. To enhance efficiency in the area of MW-6, we installed separate 1-inch lines leading from each well to the treatment system. The flow meters were then installed at the end of each line inside the shed. Currently we are removing unnecessary floats and trouble shooting the control panel to eliminate sporadic discharge and frequent prolonged shutdowns.

NPDES and Air Use Permit Compliance

Treated water samples were collected in accordance with the conditions of our NPDES permits, during the bi-weekly Operations and Maintenance (O&M) visits. Analytical results from the sampling events on the water indicate that concentrations of the regulated parameters (e.g., BTEX and MTBE) were below those allowed by our NPDES permits.

Approximately 4,351,530 gallons of groundwater were treated and discharged at the Parks and Recreation Garage. The reported discharge totals are from the beginning of August 2000 through January 2001. Effluent water samples were obtained on a weekly basis with exceptions in the months of September, December, and January due to system shutdowns. The analytical results indicated that BTEX, MTBE and PNA concentrations were below method detection limits in the effluent samples. The results for the water samples are summarized in the Discharge Monitoring Reports (DMRs) which we have been sending you on a regular basis. We have included the results of the analytical data in Appendix B along with the monthly O&M reports.

Long Term Monitoring Program

NTH completed quarterly groundwater monitoring events in October 2000 and January 2001. Monitoring included a determination of the water level, free product thickness, and the collection of water samples. The sample locations included monitoring well nos. MW-2, MW-6, MW-10, MW-11 and MW-112, and piezometer nos. P-1, P-2, and P-3. Except for MW-6 and MW-11, the analytical results for both sampling events indicated that BTEX, MTBE and PNAs were either below detection limits or below the Public Act 451, Part 213 Tier 1 residential, risk-based corrective action groundwater cleanup levels. Free product was not encountered in any of the sampling locations. The analytical results of the quarterly sampling are presented in Appendix A.

As you are aware, review of the groundwater analytical data (June 2000) for MW-11 suggested the possibility of a second source of unanticipated contamination. To confirm a second source, three geoprobes were completed (MW-11A, MW-11B, and MW-11C) around MW-11 to obtain water samples. As anticipated from the groundwater flow direction, the analytical results for MW-11A show benzene concentrations of 11-ppm. However, there was a sharp decrease in BTEX concentrations for the October quarterly sampling event at MW-11. January quarterly groundwater data for the BTEX concentrations at MW-11 was non-detect. We will be able to further evaluate these results once the treatment system is again fully operational.

As previously indicated, BTEX concentrations at MW-6 are not being effectively reduced by the system's current capture zone. The quarterly analytical data for the months of October 2000 and January 2001 demonstrates that the work completed to increase the influence of the zone of capture was necessary. We will know the results of our efforts upon completing the quarterly sampling event for April 2001.

Equipment Shutdowns

In general the system was completely operational in August, October, and November. The only documented de-watering system shutdowns for these months occurred on August 7 and 24, 2000. Extended de-watering system shutdowns occurred in the months of September, December, and January 2000. The system was either completely shut down or there was no discharge observed by our operator. To eliminate this problem we are trouble shooting the control panel and are removing unnecessary float mechanisms.

The vapor extraction system experienced shutdowns during the months of August 2000 and January 2001. These shutdowns were the result of carbon filter changes, power failures and maintenance.

Summary

In summary, we have maintained compliance with our NDPES General permit No. MIG080000 and Certificate of Coverage MIG080506 by completing routine site visits and collecting effluent water samples on a weekly basis. Water samples were not collected if the system was down or there was no visible discharge.

The remediation system at the Parks and Recreation garage has been effective at reducing the BTEX, MTBE and PNA concentrations at all monitoring wells with the exception of MW-6. To correct this we installed three separate lines leading from the de-watering wells. The modification will increase the pumping efficiency, which will increase the influence of the capture zone in the area of MW-6. At the completion of the quarterly groundwater monitoring scheduled for April 2001 we can appraise the effect of the modification.

Analytical data from the quarterly groundwater data for January 2001 indicated that BTEX, MTBE and PNA concentrations were below method detection limits at MW-11. This may indicate that the cause of the new source has been corrected.

Please call if you have any questions, or if we can provide additional information.

Sincerely,

NTH Consultants, Ltd.

RE: Suspected Release from UST at 415 W. Washington, City of Ann Arbor

Dear Karen:

As we discussed on the telephone yesterday, the City of Ann Arbor owns a 1,000 gallon underground diesel fuel storage tank at property located at 415 W. Washington in Ann Arbor. The tank was tightness tested on 9/18/89. On 9/19/89 test results were verbally reported by the tank tester to TGI, and by TGI to the City of Ann Arbor, indicating a suspected leak. A leak rate of 0.253 gal/hr was indicated; however, the tank tester felt that an air pocket in the tank or an underground pipe could have been responsible for the test results. The City notified both the State and local Fire Marshall of the suspected release on 9/19/89.

The tank has been taken out of service and steps are being taken to confirm the release. A fuel supply contractor was contacted to pump out the tank at the earliest possible time. In the interim fuel has been pumped into City vehicles to the extent practicable; the tank should be emptied by today.

At present the City is planning excavation and removal of the tank, which will include the required site assessment. We will continue to keep you informed of project developments.

Sincerely,

Steve Koster, P.E.
Engineering Manager

RE: City of Ann Arbor
415 W. Washington Tank Removal Site
Initial Abatement Measures (20 Day Report)

Dear Betty:

The following is a summary of the tank pull conducted at 415 W. Washington, which is owned and operated by the City of Ann Arbor. A 1,000 gallon diesel underground storage tank was pulled and temporarily stored on site on December 19, 1989.

The tank was overlain by a concrete slab which ranged from one to three feet in thickness. Once the concrete slab was removed, the tank was exposed approximately one foot beneath the soil surface. There was a gasoline odor present as soon as the soil adjacent to the tank was disturbed.

Upon removal of the tank from the pit, one grab sample of soil was collected from each end of the pit then heated prior to being screened with an HNU Meter. The sample from the north end screened 100 parts per million (ppm). The south end, where the fill pipe was located, screened 110 ppm. Neither ground water nor free product were encountered.

One soil sample was collected at each end of the tank pit and submitted to an analytical laboratory for BTEX analysis. Results of the analysis can be found in the table below and also in the analytical report provided.

SAMPLE	DATE COLLECTED	TOTAL BTEX (PPM)
Soil (north)	12/19/89	< 0.01
Soil (south)	12/19/89	< 0.01

Upon removal, the tank appeared to be in relatively good condition. The release was reported to the State of Michigan Fire Marshal Hotline Service on December 20, 1989 by Dan Cullen, City of Ann Arbor Risk Manager. The tank was rendered useless by cutting a hole in the side, cleaned per TGI specifications which are based on API recommended practice 1604, and transported to a disposal facility.

The site was backfilled to original grade level as the area supports heavy traffic and an open pit would have posed a safety hazard.

While soil at the site appeared discolored, analytical laboratory results indicate BTEX is not present in the soil, which meets MDNR suggested cleanup criteria as outlined in the State of Michigan Fire Marshal UST Newsletter dated June, 1989. Based on the analytical data, the City of Ann Arbor requests you consider the site closed. If you disagree with the stated conclusion, please contact TGI or Dan Cullen immediately.

If you have any questions regarding the tank pull operation, please contact Jenny Gosling, Project Engineer.

Sincerely,

Michael F. Leahy
Field Hydrogeologist

Dear Betty:

RE: CITY OF ANN ARBOR
20 DAY REPORTS, UST REMOVAL SITES

As discussed in our phone conversation on January 17, 1990, TGI has complied sampling chronologies for the following four sites:

Site:	Address
o Huron Hills Golf Course	3465 E. Huron River Drive,
o Fire Station #2	1510 E. Stadium Boulevard,
o Leslie Golf Course	2120 Traver Road, and
o 415 W. Washington	415 W. Washington.

Field log books for the sites in question have been reviewed and dates for HNU readings, excavation and sampling for each site are outlined below.

Huron Hills Golf Course

A reading of 40 parts per million (ppm) was obtained on 12/13/89 at 12:15 a.m. Following the positive reading, a total of 30 cubic yards of soil was removed from the site. The post excavation HNU reading was 4 ppm. On 12/18/89 an additional 10 cubic yards of soil was removed. Soil samples were collected from the pit bottom on 12/21/89 and submitted to an analytical laboratory for analysis. Results were discussed in the 20 day report. The site was backfilled on 1/3/90.

Fire Station #2

An HNU reading of 100 ppm was obtained from the 500 gallon gasoline tank pit located in the front of the station on 12/14/89. Following the positive reading, a total of 15 cubic yards of soil was removed. Two post excavation soil samples were collected from the pit bottom and submitted to an analytical laboratory for analysis. The pit was backfilled immediately as the excavation endangered the adjacent active diesel tank.

Readings of 2 to 9 ppm were collected from the 1000 gallon fuel oil tank pit located at the rear of the station on 12/13/89 and 12/14/89. A total of 30 cubic yards were excavated from the pit on 12/14/89. Two post excavation soil samples were also collected from the pit bottom on 12/14/89 and submitted to an analytical laboratory for analysis. The pit was backfilled on 1/3/90.

Results from both tank pits were discussed in the 20 day report and a copy of the analytical laboratory report will be forwarded as soon as it becomes available.

Leslie Golf Course

An HNU reading of 3 ppm was obtained on 12/18/89. A total of 15 cubic yards of overburden soil was removed the same day and stockpiled on site. Soil samples were collected from the pit bottom on 12/18/89 and submitted to an analytical laboratory for analysis. Results of the analysis were present in the 20 day report. The stockpiled soil was removed from the site on 1/2/90 and the pit was backfilled on 1/3/90.

415 W. Washington

An HNU reading of 100 ppm was obtained on 12/19/89. Two soil samples were collected from the pit the same day and then the pit was backfilled. Results of the analysis were outlined in the 20 day report.

If you have any questions or require further information, please contact myself or Steve Koster, Engineering Manager.

Sincerely,

Jenny E. Gosling

Date Release reported to the State Police/State Fire Marshal UST Division: March 6, 1992.

Number of USTs: **one**
Tank size(s): 6,000 gallon
Chemical or liquid that was stored in the tank: Unleaded Gasoline
No other liquids or chemicals were known to have been previously stored in the UST(s).

Description of the release: UST system failed tank tightness test and hydrocarbon odors observed from the soil.

Component of UST system from which the release occurred: product line near tank

Steps taken to prevent further release:

1) Tank was pumped dry of liquid contents on **March 9, 1992**;

Steps taken to mitigate/monitor fire and/or safety hazards:

1) Tank was pumped dry of liquid contents;

Free hydrocarbon product was not noted in the subsurface.

No vapors or free product were detected in nearby subsurface structures.

Soil Samples taken: none.

Following the removal of the underground storage tank, initial remediation will consist of contaminated soil being excavated and transported for disposal at a properly secured landfill. The MDNR will be given notification prior to remediation.

Tank location in reference to the facility buildings can be seen on the attached site sketch.

City of Ann Arbor
Parks and Recreation Building
415 West Washington Street
Ann Arbor, Michigan

Dear Terry:

This letter is a follow up to our telephone conversation on March 13, 1992 concerning the above referenced site. As discussed in our conversation, the City of Ann Arbor requests MDNR permission to excavate immediately following the tank removal without waiting for analytical results. You stated that this was permissible and to proceed with the excavation.

A confirmed release for the tank system was faxed to the Michigan State Police \ State Fire Marshal Underground Storage Tank Division on March 6, 1992. A 20-day report for the release has been forwarded to you. The Traverse Group, Inc. (TGI) will use a photo-ionization detector to screen soil samples from the excavation. We have tentatively scheduled the tank removal and soil excavation for Wednesday March 18, 1992.

Thank you for your time. Please call if you have any questions.

Sincerely,

Peter J. Weglinski
Staff Engineer

RE: 45 Day Report
The City of Ann Arbor Parks and Recreation Garage
415 West Washington Street
Ann Arbor, Michigan 48103

Dear Terry:

The Traverse Group, Inc. (TGI) has been retained by the owner/operator of the underground storage tank (UST) systems at the facility named herein, to conduct environmental consulting services relating to permanent closure of two UST systems at the above mentioned site.

The following is a site characterization report, free product recovery report and investigative work plan, all of which are part of the 45 Day release report requirements per the Leaking Underground Storage Tank Act (1988 P.A.478, as Amended). A confirmed release of petroleum hydrocarbons was reported on March 6, 1992 to the Michigan State Police/State Fire Marshal Division. Information relating to this release can be found in the enclosed report. Initial Abatement measures completed to date for the Parks and Recreation Garage are outlined in the 20 Day Report submitted to you by TGI, dated March 13, 1992. At this time, it is believed that both the soil and ground water have been impacted at the site.

If you have any questions, please call Mark Tussing, Project Coordinator, or myself at your earliest convenience.

Sincerely,

Eric P. Helzer
Staff Engineer

1.0 SITE CHARACTERIZATION REPORT

1.1 Site Description

The City of Ann Arbor's Parks and Recreation Garage is located at 415 West Washington between First and Third streets. The Ann Arbor Railroad is adjacent to the site on the east side. The Well Log Site Sketch, which illustrates the site in reference to topographic features, roads and railroads, can be found in Appendix A, page A-1. The site is secured with a 6 foot chain-link fence around its perimeter. The structures currently on the site are a garage building in a U-shape, and a storage shed. The garage houses and services the vehicles and equipment used by the City of Ann Arbor Parks and Recreation Department.

The unleaded gasoline and diesel underground storage tanks (USTs) addressed in this report were located approximately 20 feet southwest of the storage shed underneath 2-3 feet of reinforced concrete. Figure 2 (page A-2 of Appendix A), Site Sketch, provides an overview of the site showing the location and dimensions of the buildings. Each former UST had a maximum capacity of 6000 gallons. The tanks were within 3 feet of each other in a parallel arrangement and had dimensions of 28 feet in length by 5 feet 10 inches in diameter. The tanks were constructed of bare steel without an interior lining. One tank stored diesel fuel and the other unleaded gasoline. The release that is the subject of this report occurred from the unleaded gasoline UST used to fuel the City of Ann Arbor Parks and Recreation vehicles. The bottoms of the USTs were situated on top of natural soil at approximately 8-9 feet below grade. The Site Sketch Detail, shows the USTs location in reference to nearby structures and can be found in Appendix A , page A-3.

1.2 Nature and Description of the Release

1.2.1 Nature of the Release

A confirmed release was reported to the Michigan State Police/State Fire Marshal Division by The Traverse Group, Inc. (TGI) on March 6, 1992 as a result of a failed tank tightness test on March 6, 1992 at 9:50 am. There was also visual confirmation of the release from the product line near the tank.

1.2.2 Description of the Release

At this time, it is believed that both the soil and ground water resources have been impacted as a result of the release. The release was due to the UST system's corroded product line. The quantity of the release is not accurately known.

1.2.3 Steps Taken to Prevent Further Release

On March 9, 1992, both tanks (unleaded and diesel) were pumped dry of their liquid contents. The USTs were triple rinsed on March 19, 1992 by Carlo Environmental Technologies (CET) of Mt. Clemens Michigan and removed on March 20, 1992.

1.3 Available Sources and Site Investigation Data

1.3.1 Surrounding Population

The City of Ann Arbors Parks and Recreation Garage is located at 415 West Washington in the City of Ann Arbor, Section 29 of Ann Arbor Township, Washtenaw County. The 1990 census indicated that the population of the City of Ann Arbor is 109,592. The site is surrounded by both commercial and residential properties.

1.3.2 Water Quality

Information collected to determine aquifer vulnerability, potable and non-potable water sources, and surface water impact, is outlined in detail below.

1.3.2.1 *Well Logs*

The Washtenaw County Environmental Health Department was contacted for the purpose of locating wells within a one mile radius of the site. The following is a summary of the well logs located in the area. The Township, Range, and Section Numbers of the wells are included in the first column. If further information is required, please refer to the attached well logs in Appendix B, pages B-1 to B-20.

Township, Range, Section #	Number of Wells	Average Depth to Bottom of Well (feet)	Use
T2S, R6E, Sect. 19	3	192	Domestic
T2S, R6E, Sect. 28	4	112	Science
T2S, R6E, Sect. 29	2	132	Domestic
T2S, R6E, Sect. 30	2	100	Domestic
T2S, R6E, Sect. 31	2	213	Domestic
T2S, R6E, Sect. 32	6	235	Test Well
T2S, R6E, Sect. 33	1	56	Domestic

1.3.2.2 *Surface Water*

The nearest major surface bodies of water are First and Second Sister Lakes, located approximately 2 miles west of the site. In addition, the Huron River is located approximately 3/4 miles northeast of the site. The location of the Huron River, which is the nearest surface water body, can be seen on Figure 1, Appendix A, page A-2. The Allen Creek Drain which at one time was a surface body and serves as the drainage basin for the area. It is located approximately 50 feet east of the site.

1.3.3 Use and Locations of Potentially Affected Wells

Based on the well logs located within a one mile radius of the site, it is believed that the wells have not been affected by the release from the UST systems. The aquifer that has been impacted is a perched aquifer located approximately six feet below grade and is not the aquifer used for domestic wells in the area. The aquifer utilized for the domestic wells is located at approximately 89 feet below grade and is overlaid by approximately 35 feet of impermeable clay. The domestic wells located within a one mile radius of the site (Figure 1, Appendix A page A-1), are believed to have been unaffected due to their location with respect to the site and information obtained from the well logs. The wells closest to the

site are described in the well logs contained in Appendix B, pages B-8 and B-10. The commercial/residential area immediately surrounding the site is served by municipal water.

1.3.4 Subsurface Soil Conditions

The well logs obtained from the Washtenaw County Environmental Health Department employ descriptions commonly used by the well construction industry and were not used to summarize the site geology. As part of the free product investigation three monitor wells were installed. The free product investigation is outlined in section 1.5. The geology of the area was summarized from information obtained during the placement of the free product investigation monitoring wells on March 27, 1992.

Observations made during placement of the monitoring wells indicate that the soil in the immediate tank pit area appears to be backfill material. The soil strata observed during placement of the three monitoring wells can be summarized according to the following table:

Depth Below Grade (feet)	Soil Strata
0 - 8	Fill Material
8 - 13	Medium Grained Sands

Note: Ground Water at approximately 6 feet below grade.

If further information is required please refer to the attached well logs for both the domestic wells located in Appendix B and the monitoring wells located in Appendix C. The locations of the monitoring wells in reference to the pit can be seen in Appendix A, page A-3.

1.3.5 Locations of Subsurface Utility Lines and Sewers

Twelve-inch storm sewers are located approximately ten feet north and approximately 40 feet east of the former USTs. The storm sewers empty into the Allen Creek Drain which is located approximately 50 feet east of the former UST site. An underground electrical line is located northeast of the former USTs connecting the garage to the storage shed. Utility locations in relation to the former USTs can be seen on Figure 4 in Appendix A, page A-4. The figure is a blueprint copy obtained from the Ann Arbor City Records.

1.3.6 Climatological Conditions

Climatological conditions are typical of those encountered in southeast Michigan.

1.3.7 Land Use

The site is currently used by the City of Ann Arbor Parks and Recreation Department. The garage located at the site houses and services the vehicles and equipment.

1.4 Results of Site Characterization

The following information has been used to characterize the site: the initial abatement measures taken on-site prior to and following confirmation of the release and the information provided in Section 1.2 through 1.3 of this report.

The following conclusions are made based on site characterization: the extent of the impacted resources has not been determined, both soil and ground water have been impacted, and the public health does not appear to be at an immediate risk.

1.5 Free Product Investigation

The following section contains a chronological order of events concerning the discovery of free product, monitoring well placement to address free product, measurement of product levels in the monitoring wells and a free product recovery system design.

1.5.1 Discovery of Free Product

A confirmed release from the 6000 gallon unleaded gasoline UST was reported to the Michigan State Police/Fire Marshal Division on March 6, 1992 by TGI as a result of a failed tank tightness test. There was also a visual confirmation of the release which was a result of corroded piping. The quantity of the release is not accurately known. The tank was pumped dry of liquid contents on March 9, 1992.

The tank removal process was initiated on March 19, 1992 with the triple rinsing of the tanks. The rinseate was containerized in properly labeled 55 gallon barrels, and stored on the site awaiting proper disposal. Following the tank rinsing, the concrete cap overlying the tanks was demolished. During the tank excavation operation, gasoline saturated soil was encountered on the south side of the unleaded gasoline UST and free product began pooling shortly thereafter. TGI postponed excavation and the local fire marshals office was contacted. Upon arrival Dennis Hasley, Ann Arbor's Fire Marshal, instructed CET to soak up the small (approximately 5 to 10 gallons) puddle of free product with the overburden soil.

Free product was not observed to be re-pooling and the removal of concrete was resumed with the Fire Marshal's approval.

On March 20, 1992, removal of the overlying concrete was completed and excavation of the soil surrounding the UST began. Upon removal of the unleaded gasoline UST pooling product returned to the excavation and the local fire marshal was contacted (see Appendix F, page F-1). The fire marshal poured an emulsifier onto the pooling product, and granted permission to proceed with removal of the second UST, see Appendix F page F-1 for the tank disposal receipt. TGI then made arrangements to have the product and water pumped from the excavation. One hour and twenty minutes later Michigan Pumping Service began vacuum pumping the product and water. Pumping continued until product was not visible. Approximately 1200 gallons was pumped over a period of approximately one and one-half hours, see Appendix E page E-1 for disposal manifest. Product continued to reenter the excavation. It was then determined that a free product investigation should be immediately initiated. A total of ninety-six cubic yards (yd^3) of impacted soil were removed from the site and properly disposed of at the City of Ann Arbor Landfill, see Appendix G for the landfill receipts. Additionally, 24 yd^3 of concrete was transported to Belville, Michigan for crushing.

Over the weekend free product re-entered the excavation and additional product and water was pumped by K & D on Monday, March 23, 1992, see Appendix E page E-2 for the disposal manifest. Approximately 1100 gallons of product and water were pumped from the excavation. After the pumping, a sheen of product appeared on the water that re-entered the excavation. After completion of the pumping, removal of impacted and concrete was resumed. Throughout the course of the day 96 yd^3 of excavated soil and 168 yd^3 of concrete were removed, see Appendix G for landfill receipts.

Water samples were collected from the tank pit for waste characterization to arrange for proper disposal of the pit water at the City of Ann Arbor's waste water treatment plant. Samples were stored on ice in a cooler and submitted to Environmental Quality Laboratory (EQL) for analyses on March 24, 1992. Samples were analyzed for Benzene, Toluene, Ethylbenzene and Xylenes (BTEX). Laboratory results received on March 30, 1992 from samples taken on March 24, 1992 indicate total BTEX constituents of 58.9 parts per million (ppm). Laboratory reports for this sampling event can be found in Appendix D, page D-1.

1.5.2 Monitoring Well Construction

The extent of the free product at the site was investigated by placing three flush mount monitoring wells on April 27, 1992. The locations of the wells are illustrated in Figure 3, Appendix A, page A-3. The wells were placed near the areas where pooling free product was observed during the excavation process. The purpose of the well placement was to determine the depth to the water table and the thickness and extent of the free product.

The monitoring wells were placed by CET and supervised by the on-site TGI professional. Monitoring well MW-1 was constructed using a two-inch inside diameter galvanized steel casing with a five foot, #6 slot, stainless steel screen. Monitoring wells MW-2 and MW-3 were constructed of a two-inch inside diameter Polyvinylchloride (PVC) casing with a five foot, #10 slot, PVC screen. The screens for the wells were set so that at least one foot of the screen was above the surface of the water table. A #7 silica filter sand was placed from the bottom of the well screens to approximately one foot above each screen. All three wells were capped with a one foot thick bentonite pellet seal. The annular space for well MW-1 was backfilled with a mixture of portland cement and bentonite to within one and one-half feet of grade level. Natural cuttings were used to backfill the annular space of wells MW-2 and MW-3 to within one and one-half feet of grade level. The remaining annular space for all three wells was filled with concrete. The wells were finished with flush mount protective covers set in concrete. The well logs are contained in Appendix B. On the same day that the wells were placed, monitoring well MW-1 was developed using a grout pump. Monitoring wells MW-2 and MW-3 were not developed.

1.5.3 Measurement of Product Levels

The stratum of free product at the site was investigated on March 30, 1992 by visually inspecting the water surface in the three monitoring wells using a product thickness sampler designed by TGI. The sampler is comprised of a tube about 3 feet in length by one and one-half inches in diameter with a plug at the bottom attached to a rope. The plug is allowed to move freely at the bottom while attached to the rope enabling the user to open or close the tube at will. The sampler bottom, the end with the plug attached to the rope, is lowered to a level below the suspected product level in the monitoring well with the bottom of the tube unplugged. This allows the sample to be collected undisturbed. At the appropriate location in the well the plug is pulled up into the bottom of the tube. The sampler then is pulled out of the well and the result is an undisturbed sample indicating the thickness of the free product. The results of the March 30, 1992 observations are shown below.

Location	Product Thickness (inches)
Monitoring Well MW-1	approximately 33
Monitoring Well MW-2	Sheen
Monitoring Well MW-3	Sheen

Although monitoring well MW-1 contained approximately 33 inches of free product, it is believed that capillary action and the removal of overburdened pressures due to the open bore hole caused an elevated reading.

1.5.4 Free Product Removal System Design

From the results of the observed product levels in the monitoring wells, it was determined that the best position for free product recovery would be from the area located near monitoring well MW-1, (see Appendix A, page A-3). Monitoring well MW-1 had a significant amount of free product to justify the placement of a free product recovery well in the vicinity of MW-1.

On Monday, April 13, 1992 the excavation was backfilled and a free product recovery well was constructed from a 12-inch diameter, 10 foot long, #20 slot, PVC screen. Pea gravel was placed from the bottom of the well screen to within one and one-half foot of the grade surface. The remaining annular space was filled with concrete and finished with a flush mount protective cover set in concrete. The well is located approximately 8 feet west of monitoring well MW-1. Product recovery will be accomplished using an oil/water separating unit. The product will be collected for disposal, and the water effluent will be discharged into the city sanitary sewers per the city of Ann Arbor's Waste Water Treatment Plant guidelines. Monitoring well MW-1 will be used to monitor the system's recovery rates.

2.0 SITE INVESTIGATION WORK PLAN

2.1 Abatement Measures

Abatement measures conducted to date have been limited to the removal of the USTs, the proper disposal of 192 cubic yards of impacted soil, removal of free product by pumping the excavation pit and initial construction of a free product removal system.

2.2 Additional Investigation

An investigation will be conducted to ascertain the vertical and lateral extent of the impacted soil and ground water at the site. The investigation will consist of a preliminary hydrogeological investigation and a soil boring investigation. The following sections describe the methodology that will be used, upon MDNR approval, to define the extent of contamination at the site.

2.2.1 Hydrogeological Investigation

The hydrogeological investigation described below consists of the placement of three monitoring wells, soil sampling during the placement of the wells, surveying of the wells, measuring static water levels in the wells and sampling of the wells. Each task is described in detail in the following sections.

2.2.1.1 *Ground Water Monitoring Well Placement*

The first phase of this work plan will be a preliminary hydrogeological investigation. This phase of the work plan will be implemented by placing three monitoring wells on the site to establish ground water flow direction, gradient and quality. Monitoring well MW-1 placed on March 27, 1992 will be one of the three wells used for this investigation. The other two wells will be constructed in the same manner as monitoring well MW-1, outlined in section 1.5.2. The wells will be installed using a drill rig equipped with seven-inch outside diameter hollow stem augers. The wells will be constructed of two-inch inside diameter galvanized steel casing with a five foot, #7 slot, stainless steel screen. The screens will be set so that at least one foot of the screen is above the surface of the water table. A #7 silica filter sand will be placed from the bottom of the well screen to a minimum of one foot above the screen and will be capped with a one foot thick bentonite pellet seal. A mixture of portland cement and bentonite will be used to fill the annular space to within one and one-half feet of grade level. The remaining annular space will be filled with concrete. The wells will be finished with a flush mount steel cap set in concrete.

Augers, well construction materials and sampling equipment will be steam cleaned prior to each use to prevent cross contamination. The soil cuttings created from the placement of the monitoring wells will be containerized in 55 gallon barrels, properly labeled and stored on the subject site until transportation arrangements for proper disposal are made.

After placement, the monitoring wells will be developed according to industry standards. The purged water will be containerized in 55 gallon barrels, properly labeled and stored on the subject site until arrangements for proper disposal are made.

Upon obtaining closure of the site by the MDNR, the wells will be abandoned by filling them with concrete.

2.2.1.2 *Well Installation Soil Sampling and Analyses*

During placement of the monitoring wells continuous split spoon soil samples will be collected from two feet below grade to the soil/water interface located approximately six feet below grade. The samples will be field screened using an Organic Vapor Meter (OVM) equipped with a Photo-ionization Detector (PID). A maximum of two samples from each boring will be submitted to an analytical laboratory for analyses of BTEX, Poly Nuclear Aromatics (PNAs), and total Lead. The samples submitted for analyses will be those with the highest PID readings from each boring. In the event that all the soil samples collected from a particular boring obtain a reading of zero on the PID, then the soil sample collected from the capillary zone will be submitted for analyses. These analyses will be performed by methods outlined in the MDNR draft document "Recommended Parameters, Analytical Methods, and Detection Levels at Lust Sites", dated April, 1991.

Sterile sample jars supplied by the analytical lab will be used to containerize the sampled soil. Samples will be stored in a cooler for transportation to an analytical laboratory. All sampling equipment will be thoroughly cleaned between sampling events. Standard chain of custody procedures will be followed.

2.2.1.3 *Monitoring Well Sampling and Surveying*

The monitoring wells will be surveyed using a registered surveyor to determine spacial locations to the nearest 0.1 foot and top of casing elevations correlated with USGS benchmark datum to the nearest 0.01 foot.

The wells will be given seven to ten days to stabilize. After this stabilization period, static water levels will be measured for each well to the nearest 0.02 foot. Following the measurement of static water levels, a minimum of three well volumes of water will be purged prior to sampling. Water table data will be used to calculate ground water flow direction and gradient. Water samples will be collected from each well using a stainless steel hand bailer. The sampled water will be submitted for laboratory analyses of BTEX, PNAs and dissolved lead to determine ground water quality. These analyses will be performed by methods outlined in the MDNR draft document "Recommended Parameters, Analytical Methods, and Detection Levels at Lust Sites", dated April, 1991.

Sterile sample jars supplied by the analytical lab will be used to containerize the sampled water. Samples will be stored in a cooler for transportation to an analytical laboratory. All sampling equipment will be thoroughly cleaned between sampling events. Standard chain of custody procedures will be followed.

2.2.2 Soil Boring Investigation

2.2.2.1 *Plume Delineation*

The extent of the ground water and soil contamination will be determined in terms of location, constituents, and concentrations by ground water and soil sampling as well as on-site analysis. The extent of the hydrocarbon impacted resources will be delineated by tracking BTEX and PNA concentrations.

The sampling procedure will involve using a drill rig equipped with 4 1/4-inch inside diameter hollow stem augers and an on-site field laboratory specially equipped for analyses by Environmental Protection Agency (EPA) methods 8020 and 602 for BTEX and method 8310 for PNAs. The detection limits will be 10 parts per billion (ppb) for EPA method 8020, one ppb for EPA method 602, 300 ppb for soil samples analyzed by method 8310 and five ppb for ground water samples analyzed by method 8310. The field lab uses the same equipment and standard operating procedures found in analytical laboratories, allowing for immediate on-site analysis of samples.

The on-site analysis will be conducted by Environmental Quality Laboratories (EQL) of Sterling Heights, Michigan. The analytical work will be performed using a Varian gas chromatograph and a Varian high performance liquid chromatograph (HPLC). Concentration values will be permanently recorded on hard copy output. Standard quality assurance/quality control procedures will be followed including sample surrogate spiking, sample duplicates, method blanks and matrix spikes.

Soil samples will be collected during the investigation using a twenty-four inch split spoon sampling device. The soils will be sampled at two intervals; two to four feet below grade and four to six feet below grade. The samples will be field screened using a PID and the resulting concentration will be entered into a log book dedicated to the site. The soil sample with the highest PID reading from each boring will be submitted to the on-site laboratory. In the event that both soil samples produce a zero reading on the PID the sample collected from the capillary fringe (4-6 feet below grade) will be submitted for analyses. The soil samples will be containerized in sterile sample jars supplied by the analytical laboratory. The samples will be stored in a cooler for transportation to the on-site laboratory. Standard chain of custody procedures will be followed.

Ground water samples will be collected using a lead screened hollow-stem auger advanced into the aquifer 5 feet. The samples will be collected using a stainless steel bailer inserted down the auger "string" to the sampling interval. Prior to the collection of the ground water samples a minimum of two auger "string" volumes of water will be purged. The purge water will be containerized in properly labeled 55 gallon barrels and stored on the site until arrangements for disposal are made. The ground water samples will be containerized in sterile sample jars supplied by the on-site laboratory. The samples will be stored in a cooler for transportation to the on-site laboratory. Standard chain of custody procedures will be followed.

Sample locations will be chosen along transects across and along the hydraulic gradient as determined by the preliminary hydrogeologic investigation. Sampling will begin downgradient of the contaminant source area in a line running laterally across the plume until both sides of the plume are reached. After both sides of the plume are defined, a second transect will be made perpendicular to the previous transect down the center line of the plume. The transect will continue until the leading edge of the plume is reached. An additional lateral transect may be necessary to completely define the plume's leading edge.

The amount of spacing between holes along a transect will be based on sample analysis results and will be left to the discretion of the on-site TGI staff professional. The soil borings and soil and ground water sampling will continue until the plume has been adequately defined. Boring logs will be maintained to characterize the soil strata encountered during drilling.

After the plume has been adequately defined using the methodology described above, a soil boring will be conducted upgradient from the plume to determine the stratigraphy, thickness of the aquifer, the depth to the confining layer, and the thickness of the confining layer. The soil boring will be advanced a maximum of five feet into the confining layer to minimize the risk of aquifer cross contamination. Samples will not be collected during this boring.

2.2.2.2 *Plume Monitoring*

After the plume delineation has been completed, a monitoring well will be installed at the leading edge of the plume along the centerline. The ideal location for this well is outside the plume delineated in the field investigation. The purpose of this guardian well is to monitor the forward migration of the contaminant plume. Additional wells may need to be placed as determined by the on-site TGI staff professional. Potential locations include, a cluster well set downgradient from the plume (if multiple discrete zones of contamination are identified), lateral plume movement guardian wells, or wells to monitor zones of contamination from off site sources. The monitoring wells will be constructed as described

previously in the preliminary hydrogeologic investigation section 2.2.1. Well screen placement will be based on the results of the on-site analysis.

3.0 HYDROGEOLOGICAL/SOIL BORING INVESTIGATION REPORT

A written report detailing the investigation will be prepared. This report will summarize the results of the field work, analytical data and present recommend tions based on conclusions drawn from the data. Analytical laboratory reports, water table data, boring logs, well construction diagrams and a CAD map of the site will be included in the report.

4.0 PROJECT SCHEDULE

The following is a week by week schedule for work to be performed as described in this supplemental site investigation. This schedule will commence within two weeks of obtaining written approval of the work plan by the MDNR and is based on reasonable weather conditions within the period of performance. Adverse weather conditions may force a delay in the completion of any of the individual tasks presented herein.

WEEK	TASK
Week One	Schedule drill rig Call Ms. Dig
Week Two	Well placement and development
Week Three	Well surveying
Week Four	Well sampling
Week Six	Analytical results received and reviewed (assuming a 10 day turn around time for analyses)
Week Seven	Surveying results received and reviewed
Week Eight	Static water levels measured

WEEK	TASK
Week Nine	Determination of ground water flow direction
Week Ten	Soil Boring Investigation initiated and completed
Week Eleven	Analytical results reviewed and compiled
Week Twelve	Report initiated
Week Thirteen	Report reviewed
Week Fourteen	Report completed
Week Fifteen	Report submitted to MDNR

45 DAY REPORT

- ___ Release Closure
- ___ Soil & Groundwater Remediation Corrective Action Plan

COMPLETE FOR ALL REPORTS:

1. Free Product Present: Currently? (YES) NO If YES, total gallons recovered since last report: 40
   Previously? (YES) NO If YES, total gallons recovered to date: 40
2. Has the UST been emptied? (YES) NO
3. Site identified as a "lower priority" per Sec. 6e? YES (NO)
4. Distance from point of release to nearest municipal well supply: 1.5 miles No. of wells impacted: 0
5. Distance from point of release to nearest private well: 2.0 miles No. of wells impacted: 0
   Number of homes where drinking water is impacted: 0
6. Distance from point of release to nearest surface water/wetlands: 2 miles
7. Have vapors been identified in any confined spaces (basement, sewers, etc.)? YES (NO)
8. Estimated cost of proposed investigation or remedy: NA
   (Feasibility Studies, Corrective Action Plans and Hydrogeological Workplans ONLY)
9. What type of technology is being proposed/used as a remedy? NA
10. Since last report: Total cu. yards soil remediated: 0 Total gallons groundwater remediated: 0
11. Projected amount of time required to complete investigation or remedy: NA
12. Date(s) when on-site activities will be conducted: Already initiated product recovery

CERTIFICATION OF REPORT

I, John J. D'Addona (print CUSTP name), hereby attest to the accuracy of the statements in this document and all attachments. I certify that it was submitted to the MDNR on April 15, 1994 (date submitted).

ANN ARBOR, MICHIGAN

1.0 INTRODUCTION

The City of Ann Arbor, owner/operator of the former underground storage tank (UST) system at the Parks and Recreation Garage, 415 West Washington Street, Ann Arbor, Michigan, has retained The Traverse Group to prepare a Site Investigation Report for the confirmed release from the UST system.

This report summarizes the results of the site investigations proposed in Section 2.0 "Site Investigation Work Plan" of the *45-Day Report* which The Traverse Group submitted to the Michigan Department of Natural Resources (MDNR) on April 17, 1992.

2.0 SITE DESCRIPTION

The Parks and Recreation Garage is located south of Washington Street between First Street and Third Street in Ann Arbor, Michigan. The site security is a 6-foot chainlink fence and concrete wall around the site perimeter. The garage on the site is a U-shaped building which houses and services the vehicles and equipment used by the City of Ann Arbor Parks and Recreation Department. *Figure 1, Site Location Map*, shows the site with respect to topographic features, roads, and railroads.

Figure 2, Site Sketch, shows the site with respect to Washington Street, the adjacent railroad line and also illustrates the locations of the former USTs. The UST descriptions are summarized below:

Tank (as registered)	Size	Previous Contents
Tank #1	6,000 gallons	diesel
Tank #2	6,000 gallons	unleaded gasoline

The release that is the subject of this report emanated from the 6,000-gallon unleaded gasoline UST which previously contained fuel for the City of Ann Arbor Parks and Recreation vehicles.

3.0 SITE HISTORY

A failed tank tightness test at 9:50 a.m. on March 6, 1992, and visual evidence from the product line near the tank confirmed a release from the Tank #2 system. Tank #1 and Tank #2 were subsequently taken out of service and removed from the ground on March 20, 1992.

Initial abatement activities at the site included the removal, transportation and proper disposal of hydrocarbon-affected soil and ground water. Soil, ground water, and free product abatement measures to date are outlined in the following section.

4.0 ABATEMENT MEASURES

The abatement measures at the site to date have included the; removal, transportation, and proper disposal of 192 cubic yards (yd^3) of hydrocarbon-affected soil; removal, transportation, and proper disposal of 192 yd^3 of concrete; pumping of free product from the excavation pit; and the construction and operation of free product removal system.

4.1 Initial Abatement Measures

The excavation conducted, concurrent with UST removal activities, occurred on March 19, 20 and 23, 1992. The dimensions of the excavation are approximately 18 feet (north/south) by 32 feet (east/west) by 9 feet (depth). The hydrocarbon-affected soil was properly disposed of at the City of Ann Arbor landfill in Pittsfield Township, Michigan; and the free product and hydrocarbon-affected ground water mixture was properly disposed of at Environmental Waste Control in Inkster, Michigan. Landfill and liquid disposal manifests are included in The Traverse Group's *45-Day Report* submitted to MDNR on April 17, 1992.

On March 19, 1992, The Traverse Group's temporarily halted the tank excavation operation when gasoline-saturated soil was encountered on the south side of Tank #2; and free product began pooling. Upon the arrival of the Ann Arbor Fire Marshal, Carlo Environmental Technologies (CET) of Mt. Clemens, Michigan, incorporated 5 to 10-gallons of free product with the overburden soil. Free product did not repool, and the excavation of concrete was resumed.

On March 20, 1992, removal of the overlying concrete was completed, and excavation of the soil around the UST began. Upon removal of Tank #2, free product entered the excavation; and the local fire marshal was again contacted. The fire marshal added an emulsifier to the pooling free product and granted permission to proceed with removal of the second UST. The Traverse Group then arranged to have the free product and water pumped from the excavation by Michigan Pumping Service. Pumping continued until free product was not visible, and approximately 1,200

gallons of free product and water were pumped in 1-1/2 hours. Upon conclusion of pumping operations, additional free product continued to enter the excavation, The Traverse Group immediately conducted a free product investigation.

A total of 96 yd^3 of hydrocarbon-affected soil was removed from the site and properly disposed of at the City of Ann Arbor Landfill. Twenty-four yd^3 of concrete was removed and transported to Belleville, Michigan, for crushing.

During the weekend of March 21 and 22, free product again entered the excavation; and about 1,100 gallons of free product mixed with hydrocarbon-affected ground water was pumped by K and D on Monday, March 23. After the pumping, 96 yd^3 of excavated soil was removed from the site and properly disposed of at the City of Ann Arbor Landfill and 168 yd^3 of concrete was removed.

On March 27, 1992, The Traverse Group conducted an investigation with monitor wells to establish the extent of the free product at the site. The wells were placed near the areas where pooling free product was observed during the excavation. The purpose of the well placement was to determine the depth to the water table and the thickness and extent of the free product. Three (3) monitor wells (MW-1, MW-2, and MW-3) were installed at the locations illustrated in *Figure 2, Site Sketch*. The free product present at the site was investigated on March 30, 1992, by visually inspecting the water surface in the three monitor wells with a product thickness sampler designed by The Traverse Group. The results of the March 30, 1992, observations are shown below.

Well Identification	Product Thickness
MW-1	approximately 33 inches
MW-2	Sheen
MW-3	Sheen

Although MW-1 contained approximately 33 inches of free product, it is believed that capillary action and the removal of overburden pressures due to the open bore hole caused an elevated product thickness reading and is discussed further in the following section. Further information regarding the initial abatement measures, are included in The Traverse Group's *45 Day Report* submitted to MDNR on April 17, 1992.

4.2 Recent Abatement Measures

The results of the observed product levels in the monitor wells indicated that the best position for free product recovery would be from the area located near MW-1. MW-1 had enough free product to justify placing a nearby purge well. On April 13, 1992, the excavation was backfilled; and a purge well was constructed 8 feet southwest of MW-1.

During April and May of 1992 The Traverse Group monitored the thickness of the free product eleven times in MW-1 and in the purge well. The Traverse Group also pumped free product from these wells seven times resulting in the removal of approximately 17 gallons of free product. The free product was pumped directly from the wells with a pneumatic pump into properly labeled 55-gallon drums and stored on site awaiting proper disposal.

Additional information about the behavior of the free product at the site was compiled before installing a more permanent recovery system. Based on previous experience with free product at other sites of The Traverse Group, the ensuing free product recovery is often less than anticipated or the free product disappears.

Estimating the quantity of free product in the subsurface at the subject site was difficult due to the difference in product measurements from MW-1 and the purge well. The Traverse Group has concluded that the levels observed in the purge well are more representative of the "thickness" of the free product in the subsurface. This is the result of different construction techniques used when installing these two wells. An explanation of the differences observed in MW-1 and the purge well is based on the behavior of the ground water in the monitor well located in the unconfined aquifer. Water levels observed in that well indicate the top of the saturated zone; however, free product "floats" on the surface of the capillary fringe. The capillary fringe can be looked at as the transition between the saturated zone and the unsaturated zone but is actually considered to be part of the unsaturated zone. It contains water at a saturation greater than field capacity (water retained as film on grains and capillary size openings after drainage by gravity) and usually less than 100%, and has pore-water pressure that is less than atmospheric. Therefore, the thicker the fine grained soil strata, the thicker the capillary fringe. This occurs because abundant small-diameter pore throats represent closely packed small-diameter capillary-size openings {The American Association of Petroleum Geologists Bulletin v.77, No. 2 [February 1993], "Refined Gasoline in the Subsurface", Lyle G. Bruce, p. 212-224}. As a result, the behavior of free product on the capillary fringe accounts for the discrepancy observed regarding product levels in the two wells.

The critical difference between the two construction techniques was the selection of packing material around the well. The monitor well was packed with filter sand in a portion of the annular space, which preserved the capillary fringe immediately surrounding the well. The product thickness in this well was observed to be the result of a thicker capillary fringe and of free product percolating down the well, from the top of the capillary fringe onto the surface of the water table (static water level), and filling up the well to the surface of the capillary fringe where the free product is located. The purge well was placed in the open excavation before backfilling and was packed with 25 yd^3 of pea gravel from the bottom of the screen to within 2 feet of grade surface. Using pea gravel to pack the well eliminated the capillary zone immediately surrounding the well due to a lack of surface tension necessary to create the capillary fringe.

An automated free product removal system was installed on June 25 and 26, 1992. The system consists of a 12-inch-diameter PVC (polyvinyl chloride) purge well with a dedicated product skimmer. The skimmer rests at the water table and based on the surface tension of the liquid collects any liquid including free product from ground water. Once separated, the free product is pumped through a 6-inch-diameter PVC conduit to the aboveground tank. The tank receives product until the level indicator senses the tank is full and shuts down the system. The collected product is then properly disposed and the system is reactivated to resume collecting product. The aboveground portion of the system (the tank, pump, and miscellaneous tubing) also has a secondary containment dike to prevent a possible overfill to the surrounding area.

To date the system has been operated since June 26, 1992, and has recovered approximately 40 gallons of free product.

5.0 SITE INVESTIGATION

On June 1, 15, 16, and 17, July 6, 7, and 20, 1992, March 15 through 18, 1993 and November 10, 1993, eight (8) additional monitor wells and seventeen (17) soil borings were completed as part of the site investigation and to serve as future ground water quality monitoring points. The purpose of this investigation was to delineate the extent of the hydrocarbon-affected resources at the site, as well as to establish the site geology. The monitor wells and soil borings were placed at the locations indicated in *Figure 2, Site Sketch.* The investigation activities to date are presented in the following section.

5.1 Scope of Work

The site investigation methodology was outlined in the *45-Day Report.* The purpose of the proposed investigation was to ascertain the vertical and lateral extent of the hydrocarbon-affected soil and ground water at the site utilizing soil and water sampling and analyses, soil boring installation, monitor well installation, and surveying of the monitor wells. During an August 19, 1992, telephone conversation between a MDNR representative and personnel of the The Traverse Group, requested that vertical profiling be included as part of the soil boring activities outlined in the *45-Day Report*, Section 2.0 "Site Investigation Work Plan." The Traverse Group informed MDNR that vertical profiling of the ground water would be done by sampling ground water using a lead-screened hollow-stem auger advanced 5 feet into the aquifer with vertical profiling continuing in 10-foot intervals no further than the confining layer. MDNR approved this addition to the work plan. The following sections describe the methodology used to define the extent of hydrocarbon-affected resources at the site.

5.2 Monitor Well and Soil Boring Installation

The work plan was implemented on June 1, 1992, by installing MW-4 and MW-5 to establish ground water flow direction, gradient and quality. Monitor Well MW-1, installed on March 27, 1992, was to be one of the three wells used for the investigation. However, from the results of the observed product levels in MW-1, as described above, it is believed that the presence of free phase hydrocarbons did not allow the accurate measure of the static water level in the well. Therefore, an additional monitor well, MW-6, was installed on June 16, 1992, to replace MW-1 for the calculation of ground water flow direction and gradient. The wells were installed by Traverse Drilling, of Traverse City, Michigan, using a drill rig equipped with hollow stem augers. During installation continuous split spoon soil samples from 2 feet below grade (BG) to the soil/ground water interface were collected. The wells were constructed of a 2-inch inside-diameter galvanized steel casing with a 5-foot, #7 slot, stainless steel screen. The screens were set a minimum of 1 foot above the surface of the ground water table. MW-4 was constructed using a #7 silica filter sand placed from the bottom of the well screen to 3 feet above the screen and was grouted with a 5-foot-thick bentonite pellet seal. MW-5 was constructed using a #7 silica filter sand placed from the bottom of the well screen to 1 foot above the screen and was grouted with a 3.5-foot-thick bentonite pellet seal. MW-6 was constructed using a #7 silica filter sand placed from the bottom of the well screen to 1 foot above the screen and was grouted with a 4-foot-thick bentonite pellet seal. The remaining annular space at the three MW's were filled with concrete. The wells were capped and finished with flush mount protective steel covers set in concrete. The monitor well logs with the well construction diagrams (MW-1 through MW-6), are included in Appendix A, pages A-1 through A-6. Monitor well logs for MW-1, MW-2 and MW-3 were previously submitted to MDNR as part of the *45-Day Report*. However, there was an error with the logs, therefore the corrected logs have been included in Appendix A of this report.

In addition to the monitor well installations, soil borings were conducted to determine the extent of the hydrocarbon-affected soil and ground water. Seventeen (17) soil borings were completed at the site and tracking BTEX and PNAs concentrations in terms of location, constituents, and concentrations by soil and ground water sampling and analytical testing. On June 15 and 17, July 6, 7 and 20, and March 16 and 17, 1993, the borings were placed at the locations shown in *Figure 2, Site Sketch.*

The soil borings were completed using a drill rig equipped with hollow stem augers. All soil borings were completed by Traverse Drilling, except AH799 which was installed by CET. Boring locations were chosen along and across transects of the hydraulic gradient determined in the hydrogeologic investigation. Throughout the boring operations, additional boring locations were needed to further define the hydrocarbon-affected resources along utility lines, which were determined as a pathway for the migrating hydrocarbons, and around the perimeter of the hydrocarbon-affected area.

The amount of spacing between soil borings along a radial line and transect was based on field screening results. The borings and the soil and ground water sampling were continued until the hydrocarbon-affected resources were defined. The soil boring logs which describe the soil strata are illustrated in Appendix A, pages A-6 through A-19 and A-22 through A-24.

Two guardian monitor wells: MW-7, installed on July 20, 1992 by CET; and MW-9 installed on March 18, 1993 by Traverse Drilling, were placed to monitor the leading edge of the plume. The wells were placed along the Allen's Creek Drain. The wells were installed on opposite sides of the 12-foot storm drain on the north side of West Washington Street, across the street from the site. Monitor well locations are illustrated in *Figure 2, Site Sketch.*

The Traverse Group attempted to place additional soil borings within the building in the northwest direction downgradient of the source area. However, due to low clearance inside the building the borings could not be placed with the drill rig that was on-site. These borings were completed at a later date as described below.

Monitor wells MW-7 and MW-9 were constructed in the same manner as MW-5, outlined above, with the exception of their backfill installation and grouting procedure. A #7 silica filter sand was placed from the bottom of the well screen in MW-7 to 1 foot above the screen and was grouted with a 7-foot-thick bentonite pellet seal to within 1.0 foot of grade level. A #7 silica filter sand was placed from the bottom of the well screen in MW-9 to 3.5 feet above the screen and was grouted with a 1-foot-thick bentonite pellet seal followed by a 3.5-foot-thick cement and bentonite powder slurry seal to within 1.0 foot of grade level. The remaining annular space was filled with concrete. Well screen placement for both wells was based on the depth where the ground water table was encountered and screened 1 foot above the ground water table. MW-7 and MW-9 were capped and finished with flush mount protective steel covers set in concrete.

A vertical profile monitor well MW-8 was installed near MW-6 on March 15, 1993 by Traverse Drilling, to monitor the vertical migration of the hydrocarbon-affected ground water. MW-8 is also illustrated in *Figure 2, Site Sketch.* The vertical profile monitor well MW-8 was constructed in the same manner as MW-6 with the exception of its backfill installation and grouting procedure. Native sand was placed from the bottom of the well screen in MW-8 to 7 feet above the screen and was grouted with a 2-foot-thick bentonite pellet seal followed by a 4-foot-thick cement and bentonite powder slurry seal followed by a 1-foot-thick bentonite pellet seal to within 1.0 foot of grade level. The remaining annular space was filled with concrete. Top of well screen placement for MW-8 was based on the depth where MW-6 was placed, 5 feet below the screen bottom of MW-6. MW-8 was capped and finished with a flush mount protective steel cover set in concrete. The monitor well logs with the well construction diagrams (MW-7, MW-8, and MW-9), are included in Appendix A, pages A-20, A-21, and A-25.

Two additional monitor wells: MW-10 and MW-11, installed on November 10, 1993 by CET, were placed to further monitor the plume. Monitor well locations are illustrated in *Figure 2, Site Sketch.*

Monitor wells MW-10 and MW-11 were constructed in the same manner as MW-5, outlined above, with the exception of their backfill installation and grouting procedure. A #7 silica filter sand was placed from the bottom of the well screen in MW-10 to 1 foot above the screen and was grouted with a 1-foot-thick bentonite pellet seal to within 1.0 feet of grade level. A #7 silica filter sand was placed from the bottom of the well screen in MW-11 to 1 foot above the screen and was grouted with a 1.5-foot-thick bentonite pellet seal to within 2 feet of grade level. The remaining annular space was filled with concrete. Well screen placement for both wells was based on the depth where the ground water table was encountered and screened 1 foot above the ground water table. MW-10 and MW-11 were capped and finished with flush mount protective steel covers set in concrete.

Augers, well construction materials, and sampling equipment were steam cleaned before use to prevent potential cross-contamination. The soil cuttings created from the placement of the monitor wells and soil borings were accumulated in 55-gallon barrels, properly labeled, and stored on the subject site awaiting proper disposal.

After placement, the monitor wells were developed according to industry standards using a hand bailer. Approximately 20 gallons of ground water were purged during the development process of MW-4, 25 gallons from MW-5, and 20 gallons from MW-6. Approximately 103 gallons of ground water was purged during the development process of the MW-7, MW-8, and MW-9. Approximately 20 gallons of ground water was purged during the development process of MW-10, and MW-11. The purged ground water was accumulated in 55-gallon barrels, properly labeled, and stored on the site awaiting proper disposal.

5.3 Soil Sampling

Soil samples were continuously collected from 2 feet BG to the soil/ground water interface utilizing a split spoon sampling device. However, due to various fill materials in the immediate sub-surface at many of the soil boring locations, continuous split spoon soil samples were difficult to obtain from 2 feet BG. The sampling intervals for each boring are summarized in the boring logs included in Appendix A. Split spoon soil samples were field-screened using an Organic Vapor Meter (OVM) equipped with a Photo-ionization dectecter (PID). The soil samples with the highest PID readings from each boring were sent to the analytical laboratory. If all soil samples from a soil boring produced a zero reading on the PID, then the soil sample collected at the capillary zone was submitted for analysis. Additional samples were also collected for the analytical laboratory depending on soil strata and depth below grade.

The soil samples were accumulated in sterile sample jars supplied by the analytical laboratory and stored on ice in a cooler for transportation to the analytical laboratory. Soil samples were sent to Environmental Quality Laboratories, Inc. (EQL) of Sterling Heights, Michigan and Traverse Analytical Laboratory of Traverse City, Michigan, for laboratory analyses of BTEX and PNAs. However, soil samples from AH-1, AH-2, AH-3, AH17-1, AH17-2, AH17-3, AH17-4 and AH17-5 were delivered immediately to an on-site mobile laboratory operated by EQL for analyses of BTEX and PNAs. Standard chain of custody procedures were followed.

5.4 Ground Water Sampling

Ground water was sampled during the monitor well and soil boring installations using a lead-screened hollow-stem auger advanced into the aquifer 5 feet with vertical profiling continuing in 10-foot intervals until head space analyses from the water samples demonstrated decreasing OVM readings. The samples were collected using a stainless steel bailer inserted down the center of the auger flight to the sampling interval. The lead-screened hollow-stem auger is a field-screening tool used to vertically sample ground water in the uppermost water bearing zone.

Vertical profiling of the aquifer in discrete sampling intervals was to be continued to the confining layer; however, at an upgradient location from the source area, soil boring AH799 did not encounter a confining layer up to 84 feet BG. Therefore, the additional soil borings placed after AH799 were vertically profiled to various depths BG until head space analyses from the water samples demonstrated decreasing OVM readings determined by the on-site engineer. The sampling intervals for each boring are summarized in the boring logs included in Appendix A. Before collection of the ground water samples, two auger flight volumes of ground water were purged. The purged ground water was accumulated in 55-gallon barrels, properly labeled, and stored on the site awaiting proper disposal.

The ground water samples were accumulated in sterile sample jars supplied by the analytical laboratory and placed on ice in a cooler for transportation to the analytical laboratory. Ground water samples were sent to EQL and Traverse Analytical Laboratory for laboratory analyses of BTEX and PNAs. However, ground water samples from AH-1, AH-2, AH-3, AH17-1, AH17-2, AH17-3, AH17-4 and AH17-5 were delivered immediately to the on-site mobile laboratory operated by EQL for analyses of BTEX and PNAs. Standard chain of custody procedures were followed.

5.5 Ground Water Monitor Well Sampling

Three well volumes of ground water were purged from MW-1, MW-4 and MW-5 on June 5, 1992, three well volumes from MW-6 on March 3, 1993, three well volumes from MW-7, MW-8, and MW-9 on March 25, 1993, and three well volumes from MW-10 and MW-11 on November 10, 1993. The purged ground water was accumulated in 55-gallon barrels, properly labeled, and stored

on the site awaiting proper disposal. Ground water samples were collected from the wells immediately following purging using a stainless steel hand bailer.

The ground water samples were accumulated in sterile sample jars supplied by the analytical laboratory and placed on ice in a cooler for transportation to the analytical laboratory. Ground water samples from MW-1, MW-4 and MW-5 were submitted to EQL for laboratory analyses of BTEX, PNAs, and dissolved lead, while the ground water samples from MW-6, MW-7, MW-8, MW-9, MW-10, and MW-11 were submitted to Traverse Analytical Laboratory for laboratory analyses of BTEX and PNAs, to determine ground water quality. Standard chain of custody procedures were followed.

5.6 Soil and Liquid Disposal

Upon completion of the site investigation, soil waste and waste water generated and accumulated during the site investigation were properly disposed. Soil and liquid disposed manifests are included in Appendix C.

5.7 Sample Analyses

The soil and ground water samples immediately submitted to the on-site EQL mobile laboratory and the soil and ground water samples submitted to EQL and Traverse Analytical Laboratory were analyzed for BTEX and PNAs. Ground water samples from MW-1, MW-4 and MW-5 were submitted to EQL for laboratory analyses of BTEX, PNAs and dissolved Lead.

Soil and ground water analyses were performed using Method 8020 for BTEX, Method 8310 for PNAs, and Method 7421/furnace for total lead as outlined in the document *MDNR MERA Operational Memorandum #6 Revision 1 dated April 22, 1992: Analytical Detection Level Guidance for Environmental Contamination Response Activities under Act 307 Rules, Tables 1 and 2a.*

6.0 RESULTS

6.1 Soil and Ground Water Analytical Data

A total of 31 soil samples and 43 ground water samples were analyzed by the analytical laboratories. A summary of the soil and ground water sampling results is included in *Table 1.* Analytical reports of soil and ground water samples collected, quality control reports, and the document chain-of-custodies are included in Appendix B.

6.1.1 Soil Analytical Data

The concentrations of analyzed BTEX and PNAs in soil samples were below detection limits in most samples collected, with the exception of samples collected from AH-1, AH-2, AH-3, AH-4, AH17-1, AH17-2, MW-8, MW-9 and MW-10.

Soil samples collected from AH-1 and MW-8, the former dispenser area, contained elevated levels of BTEX and PNAs. The sample collected from AH-1 at 4 to 6 feet BG contained a BTEX concentration of 12,361 ppb and a PNAs concentration of 16,900 ppb. The sample collected from MW-8 at 6 to 8 feet BG contained a BTEX concentration of 263,100 ppb and no concentrations of PNAs.

Soil samples collected from AH-2, AH-3, AH-4, MW-9, and MW-10 along underground utility lines, contained elevated levels of BTEX. Two soil samples collected from AH-4, along a sanitary sewer line, contained BTEX concentrations of 17,590 ppb at 6 to 8 feet BG and 64,500 ppb at 8 to 10 feet BG. The sample collected from AH-3 at 6 to 8 feet BG along the east side of Allen's Creek Drain contained a BTEX concentration of 4,040 ppb and is below Type B criteria. The sample collected from AH-2 at 6 to 8 feet BG along the west side of Allen's Creek Drain contained a BTEX concentration of 264 ppb and is below Type B criteria. The sample collected from MW-9 at 8 to 10 feet BG along the east side of Allen's Creek Drain north side of Washington Street contained a BTEX concentration of 220 ppb and is below Type B criteria. The sample collected from MW-10 at 5 to 7 feet BG along a storm drain on the west side of Allen's Creek Drain contained a BTEX concentration of 18,060 ppb.

Soil samples collected from AH17-1 and AH17-2, areas not related to the UST source of hydrocarbon-affected soil, contained elevated levels of PNAs. Two soil samples collected from AH17-1 contained PNAs concentrations of 930 ppb at 2 to 4 feet BG below Type B criteria and 1,500 ppb at 4 to 6 feet BG below Type B criteria. The sample collected from AH17-2 at 2 to 4 feet BG contained a PNAs concentration of 7,390 ppb.

6.1.2 Ground Water Analytical Data

The concentrations of analyzed BTEX and PNAs in the ground water were above detection limits in most samples collected. Based on the number of samples that contained detectable concentrations of hydrocarbons, only a few sample results will be reported in greater detail.

The source area monitor well, MW-1, had a sample collected from 8 to 10 feet BG and contained a BTEX concentration of 62,600 ppb and a PNAs concentration of 9,098 ppb. MW-1 contained the highest concentrations of BTEX and PNAs out of all the ground water samples analyzed. MW-10 contained free product and thus was not sampled.

The ground water samples collected from AH-4, along a sanitary sewer line, contained detectable concentrations of BTEX and PNAs-affected ground water. Vertical profile water samples indicated BTEX concentrations ranging from 4,800 ppb at 10 to 15 feet BG to 26 ppb at 50 to 55 feet BG, and PNAs concentrations ranging from 1,793 ppb at 10 to 15 feet BG to non-detect at 30 to 35 feet BG. However, the analytical results (*Table 1*) establish the vertical extent of the hydrocarbon-affected ground water to be limited to 30 feet BG. The intervals sampled below 30 feet BG fluctuate and do not show consistently decreasing values that are a characteristic of a light nonaqueous phase liquid. There is no evidence or reason to suspect these hydrocarbons at these deeper intervals. Based on these facts it is believed that soils may have adhered to the screened auger and were carried down to the deeper sampling intervals, affecting the ground water as it passed over the soil on its way through the screen, thereby affecting the ground water samples collected for analyses.

The ground water samples collected during the installation of MW-8, located in the former dispenser area, contained detectable concentrations of BTEX and PNAs-affected ground water. Vertical profile water samples indicated BTEX concentrations ranging from 2,989 ppb at 8 to 13 feet BG to 604 ppb at 28 to 33 feet BG, and PNAs concentrations ranging from 1,569 ppb at 8 to 13 feet BG to 119 ppb at 28 to 33 feet BG. An additional ground water sample collected at a later date from MW-8 at it's screened interval 15 to 20 feet BG contained a BTEX concentration of 14 ppb and is below Type B criteria and no concentrations of PNAs. Therefore, it is believed that soils may have adhered to the screened auger during the installation of MW-8 and were carried down to the deeper sampling intervals, affecting the ground water as it passed over the soil on its way through the screen, thereby affecting the ground water samples collected for analyses. The monitor well screened interval (15 to 20 feet BG) more accurately establishes the vertical distribution of PNAs-affected ground water at the MW-8 location.

Ground water samples collected from AH-2 and AH-3 along the west and east side of the Allen's Creek Drain, respectively, contained elevated levels of BTEX and PNAs. The ground water sample collected from AH-2 at 8 feet BG contained a BTEX concentration of 127.2 ppb and a PNAs concentration of 1,461 ppb. The ground water sample collected from AH-3 at 12 feet BG contained a BTEX concentration of 22.4 ppb and no concentration of PNAs.

6.2 Site Hydrogeology

Based on the continuous subsurface split spoon soil sampling during the installations of the monitor wells and soil borings, the general subsurface soil conditions across the hydrocarbon-affected soil and ground water at the site appeared as follows:

The general soil lithology can be summarized as:

0 to 0.5 foot BG - asphalt/concrete
0.5 to 4 feet BG - mixed sand, stone, clay, cinder, and brick debris
4 to 7 feet BG - fine to medium silty brown sand
7 to 8 feet - moist, organics, black peat
8 to 46 feet BG - wet, fine to coarse brown sand

The water table lies at approximately 5.5 to 8 feet BG across the site. Static ground water table data are discussed in Section 7.0.

The monitor well logs and soil boring logs, describing the subsurface soil strata in greater detail, are included in Appendix A.

The site lies in a 100 year flood plain within the Allen's Creek Drainage Basin. The main branch of Allen's Creek enters the site from the south heading north, turns northwest, then again turns toward the north in the middle of the site near the former storage shed, illustrated in *Figure 2, Site Sketch.* In 1929 Allen's Creek permanently became Allen's Creek Drain and was enclosed in underground cement conduits as part of the city's storm sewer system.

Figure 3, Hydrogeologic Cross Section, illustrates a southwest-northeast cross section, constructed along the line shown in *Figure 2, Site Sketch.*

Native soils over the site are 6 to 8 feet BG and are primarily black organics. It is believed at one time back swamps or marshy areas were along the creek. Over time, organics accumulated creating the rich black organics found at the site. Below the soil lithology sand with gravel extends to depths of more than 46 feet BG across the site. A well-cemented sand unit or hardpan was encountered at 46 feet BG in the northern portion of the site (AH-5). However, this hardpan was not encountered in the southern portion of the site (AH799) within 84 feet BG.

The average hydraulic conductivity of the aquifer materials as determined by slug tests performed in MW-5, MW-6, MW-7, and MW-8, is 8.23×10^{-7} ft/sec (equivalent to 0.07 ft/day). Based on the average hydraulic conductivity value, the ground water gradients, and an estimated sediment porosity of 0.35, the average ground water velocity is 0.11 ft/yr. The ground water velocity was calculated using the formula $\upsilon = KI/\eta$, where υ is the average linear velocity, K is the hydraulic conductivity, I is the hydraulic gradient, and η is the porosity (Groundwater, Freeze and Cheery, 1979).

7.0 DISCUSSION OF SITE INVESTIGATION DATA

Soil and ground water non-detect boundaries were nearly established horizontally and vertically. Based on the results of the site investigation data, ground water contour maps as well as soil and ground water concentration contour maps were developed to illustrate the results.

- *Figure 4, Site Sketches with Ground Water Contours*, illustrates the ground water flow directions and gradients for three monitoring periods. Static ground water table data measured to the nearest 0.01 foot BTOC, along with spatial locations and top of casing elevations from the survey were used to calculate ground water flow directions and gradients. All monitor wells with the exception of MW-10 and MW-11 were surveyed by a registered surveyor to determine spatial locations to the nearest 0.1 foot and top of casing elevations correlated with United States Geological Survey (USGS) benchmark datum to the nearest 0.01 foot. Three monitor wells were used to establish the piezometric surfaces, based on their respective screened intervals BG in relation to the ground water table. Free product monitor wells MW-2 and MW-3 constructed of 2-inch schedule 40 PVC screen and riser were not used in the calculation. Free product present in MW-1 and MW-10 did not allow the wells to be used in the calculation and MW-4 was unable to be located during the last two monitoring events. MW-8 is a vertical profiling monitor well screened below the water table near MW-6 and was thus not used in the calculation. MW-9, located on the east side of the Allen's Creek Drain, was not used in the calculation because of the potential for conflicting water table data. Static ground water levels and top of casing elevations are summarized in the tables in *Figure 4*. A complete summary to date of the static ground water monitoring results is included in *Table 2*.

Ground Water Flow Data

Date	Wells Measured	Ground Water Flow Direction	Hydraulic Gradient (ft/ft)
7-1-92	MW-4, MW-5, MW-6	N75°22'W	.0022
5-14-93	MW-5, MW-6, MW-7	N13°49'W	.00141
7-13-93	MW-5, MW-6, MW-7	N11°28'W	.00141

Ground water flow data from May 14, 1993, is consistent with data obtained from July 13, 1993, as shown above. Static water levels were also collected on August 23, 1993. However, based on the low hydraulic gradient and past static water level elevations observed at the site, the August 23, 1993, data was inconsistent with July 1, 1992, data specifically with regard to static water levels at MW-5. Therefore, additional static water levels will need to collected for the set of wells from that event.

- *Figure 5, Allen's Creek Drainage Sketch*, identifies the locations of the Allen's Creek tributaries and drainage basin in relation to this site. Allen's Creek drains more than five square miles of central and western Ann Arbor. In 1926 Allen's Creek permanently became Allen's Creek Drain, a part of the city's permanent storm sewer system. The creek is enclosed in underground cement conduits to control the drainage from the creek's watershed. The main section of the conduits cuts across the 415 W. Washington property and is approximately 12 feet in diameter. Although the drain runs low most of the time, at times it is at capacity. There may be several hydraulic connections between the drain and ground water flow in the aquifer. However, it is not known at this time how the Allen's Creek Drain affects ground water flow but it appears that ground water flow does flow away from the drain on this site based on the three previous data sets. Thus, The Traverse Group recommends a monthly static ground water monitoring program to determine ground water flow direction.

- *Figure 6, Soil BTEX Concentration Contours (6'-8' Below Grade)*, illustrates the lateral profile of BTEX concentrations at 6 to 8 feet below grade. Based on the analytical data there appears to be one significant point source, the former UST, relating to BTEX in the soil. Additional data points are needed downgradient from the source area because AH-4 is at 17,590 ppb and therefore the lateral extent of BTEX-affected soils has not been delineated in the northwest direction. This can be addressed during the design of remediation systems.

- *Figure 7, Ground Water BTEX Concentration Contours (8'-13' Below Grade)*, illustrates the lateral profile of BTEX concentrations in the ground water. The initial ground water monitoring was conducted by using a lead screened hollow stem auger which nearly established the lateral extent and established the vertical extent of the hydrocarbon-affected ground water.

MW-7 and MW-9 were placed along both sides of the Allen's Creek Drain on the north side of W. Washington street in the right of way to monitor the Allen's Creek Drain which is a potential migration pathway. The purpose of these guardian wells is to monitor the potential migration of the hydrocarbon-affected ground water.

Downgradient from the source area BTEX levels at MW-1 are 62,600 ppb requiring additional delineation as part of the design and installation of the ground water treatment systems.

- *Figure 8, Soil PNAs Concentration Contours (4'-6' Below Grade)*, illustrates the lateral profile of PNAs concentrations at 4 to 6 feet below grade. Based on the analytical data there appears to be three isolated point sources relating to PNAs in the soil at AH17-2, AH17-1 (below Type B criteria) and AH-1 (near the former fuel dispensers). AH17-1 and AH17-2 point sources are unrelated to the former UST.

- *Figure 9, Ground Water PNAs Concentration Contours (8'-13' Below Grade)*, illustrates the lateral profile of PNAs concentrations in the ground water. The initial ground water monitoring was conducted by using a lead screened hollow stem auger which established the lateral extent and nearly established the vertical extent of the hydrocarbon-affected ground water.

  As described for *Figure 7* above, MW-7 and MW-9 were placed along both sides of the Allen's Creek Drain on the north side of W. Washington Street in the right of way.

  The lateral extent of PNAs-affected ground water has been delineated.

- The largest vertical distribution of the BTEX-affected soil and ground water has been established near AH-4 as being limited to 10 feet BG in the soil and 30 feet BG in the ground water. Based on the results discussed in Section 6.1.2 it is believed that soils may have adhered to the screened auger and affected the ground water samples collected for analyses at intervals below 30 feet BG.

  The vertical distribution of the PNAs-affected soils has not yet been determined to areas around AH17-2 and AH17-1 (levels below Type B criteria). However, based on the results that these are isolated point sources and the fact that ground water is not affected at theses areas it is estimated that the vertical distribution is limited. The largest vertical distribution of PNAs-affected ground water has been established near MW-8 as being limited to 15 feet BG in the ground water. Based on the results discussed in Section 6.1.2 it is believed that soils may have adhered to the screened auger and affected the ground water samples collected for analyses at intervals below 15 feet BG. The monitor well screened interval (15 to 20 feet BG) more accurately establishes the vertical distribution of PNAs-affected ground water at the MW-8 location.

8.0 RECOMMENDATIONS

Based upon the results of the site investigation activities conducted to date, the vertical limits of affected soil and ground water at the site have been defined, and additional site investigation to be incorporated in the remediation phase is recommended to further delineate the hydrocarbon-affected soil and ground water in the northwest direction. The former release source has been removed, the extent of affected soil near the former UST has been removed. Additionally, the low ground water velocity serves to limit the spread of contaminants off-site.

Based on the above observations, The Traverse Group recommends that the additional site investigation be completed in the northwest direction downgradient of the source area, the free product recovery system continue operating, that the ground water table be depressed to enhance the removal of free product as an interim corrective action measure, that a monthly static ground water monitoring program be implemented, that a quarterly ground water monitoring program be initiated until corrective action measures take place, and that a feasibility study be conducted on potential soil and ground water cleanup technologies upon further investigative results.

8.1 Free Product Removal

The free product removal efforts to date have included only the passive skimming of hydrocarbons from the present product recovery well. As an initial corrective action measure it is recommended that an active free product removal program be implemented to accelerate the removal of free product as well a emulsified free product from the subsurface. An active system would involve pumping both product and water out of a product recovery well to create a depressed ground water table. This depression creates a cone of influence in the area surrounding the recovery well which funnels the remaining trapped free product to the recovery well where it is collected and subsequently separated into oil and water.

An air driven submersible water and product pump will be installed in the present recovery well. The water and product mixture collected would then be passed through a coalescing oil/water separator to remove the trapped product from the mixture. Coalescing oil/water separators are specifically designed to remove free product as well as emulsified product. The remaining water, with an agreement with the city sanitary authority, could be discharged to the sewer. An evaluation of the present recovery well will be performed to determine if the present construction is sufficient for an active recovery program. It may be necessary to install a different recovery well if the well packing material or the size of the well is insufficient.

The active free product removal system will be operated until there is no measurable oil and grease in the influent to oil/water separator. The city sanitary authority may require oil and grease measurements of the effluent as well, before the water is discharged to the sewer. Sampling for oil and grease on the influent and possibly the effluent will be performed with the quarterly monitor well sampling, unless the city requires sampling of the effluent more frequently.

8.2 Static Ground Water Monitoring Program

A monthly static ground water monitoring program utilizing the current monitor well network (MW-1 through MW-11) at the site is recommended to determine ground water flow direction. Seasonal changes would be observed and reported to MDNR. The monitoring program proposed by The Traverse Group will be on a monthly basis for a period of one year. The primary objective of the program is to determine whether or not seasonal ground water flow direction variations exist and the impact from the Allen's Creek Drain.

8.3 Ground Water Monitoring Program

A monitoring program at the site is recommended in order to track the dissolved hydrocarbon plumes. Monitor wells MW-1 through MW-11 will be included in the monitoring program. The monitoring program proposed by The Traverse Group will be on a quarterly basis for a period of one year. The primary objective of the program is to determine whether the dissolved hydrocarbon plume is migrating to previously unaffected areas, with secondary objectives of determining whether seasonal ground water flow direction variations exist, and whether plume migration rate is dependent on ground water table fluctuations. The quarterly monitoring program may be modified at a later date based on the results of the first year of sampling and analyses.

1.0 INTRODUCTION

The Traverse Group evaluates remedial action alternatives for underground storage tank (UST) release sites and Michigan Environmental Response Act (Act 307) release sites using Act 307 Rule 299.5513, and The Leaking Underground Storage Act 478 of 1988, as amended. The basic guidelines include on-site and off-site alternatives as well as a no action alternative. Each alternative is evaluated based on technical feasibility, cost effectiveness, and considerations with respect to disposal waste minimization/volume reduction, recycling, toxicity reduction, or destruction and mobility reduction.

The feasibility study evaluation consisted of two phases; an initial screening of the possible alternative treatment technologies outlined in Section 3.0 and a detailed evaluation of alternatives outlined in Section 4.0. Finally, a recommended alternative was selected and will be submitted to the Michigan Department of Natural Resources (MDNR), pending City of Ann Arbor approval, as part of the Corrective Action Plan (CAP).

2.0 BACKGROUND INFORMATION

The City of Ann Arbor was owner/operator of the former underground storage tank (UST) system at the Parks and Recreation Garage, 415 West Washington Street, Ann Arbor, Michigan. A release was reported from the 6,000 gallon unleaded gasoline UST following a failed tightness test. The unleaded gasoline UST, as well a diesel fuel UST, were removed on March 20, 1992. An initial volume of soil was removed and properly disposed, and free product removal efforts were initiated. Free product recovery efforts continue.

Site investigation activities were conducted in June and July 1992, as well as March and November 1993, resulting in the delineation of the hydrocarbons in the soil and ground water.

Detailed background information can be found in the *45-Day Report*, submitted by The Traverse Group to MDNR on April 17, 1992, and the *Site Investigation Report for an Underground Storage Tank Release*, submitted by The Traverse Group to MDNR concurrent with this report.

3.0 INITIAL SCREENING OF ALTERNATIVE TREATMENT TECHNOLOGIES - REVIEW AND COMPARISON

The Traverse Group has compiled a listing in *Table 1, Initial Screening of Alternative Treatment Technologies Review and Comparison*, of general technologies that may be possible treatment technologies for one or more of the constituents at the City of Ann Arbor Parks and Recreation Garage (SITE). As part of the initial screening, The Traverse Group reviewed the feasibility of each technology to meet Type B Closure of the contamination constituents (in any possible media) at the SITE.

Type A Closure is attained when either of the following cleanup conditions are met for a substance:

1) The substance concentration does not exceed background levels; or

2) The substance concentration is equal to or less than the analytical method detection limits for that substance.

Type B Closure is attained when the cleanup conditions are consistent with the specified guidelines posed by the State of Michigan and substance concentrations do not exceed calculated risk levels based upon standardized exposure assumptions and acceptable risks to human health and/or environment.

Type C Closure is attained when the site cleanup conditions provides for substance concentrations that do not pose an unacceptable risk to human health and/or the environment based upon site-specific assessment. Recently, MDNR issued new Type C Cleanup Criteria for industrial facilities, which may or may not apply to the SITE.

The initial screening of remedial alternatives is to identify and screen potentially applicable technologies. Technologies are screened to eliminate those that may prove difficult to implement based on specific affected media and chemicals of concern, risk-based cleanup criteria, geology, reliance on unproven technologies (applicability/reliability), or may not achieve the remedial objectives within a reasonable time period and/or cost. This screening process focuses on eliminating those technologies which have severe limitations for a given set of contamination constituents and site specific conditions.

The following assumptions were made in compiling *Table 1, Initial Screening of Alternative Treatment Technologies Review and Comparison*:

- Target constituents at the SITE consist of Benzene, Toluene, Ethylbenzene, and Xylenes (BTEX) and Polynuclear Aromatics (PNAs).

- Remediation of the SITE consists of achieving Type B Closure for the areas defined in *Figure 1*.

- Affected media could be in the form of granular fill material, native clayey soils, and ground water.

Please note that certain conventional remedial action options (no action, limited action, etc.) have been included for the sake of comparison. However, Type B Closure cannot be achieved with these options.

Table 1, Initial Screening of Alternative Treatment Technologies Review and Comparison, is set-up into four categories as follows:

Remedial Action - this category lists the type of action that could be taken and includes the various methods to accomplish that action.

Technology - within this category are the general technologies that coincide with the remedial action. Specific processes within these technologies may exist that are highly innovative and would be evaluated as part of further detailed evaluation.

Comments - the comments coincide with the technology and were solely based on their potential for Type B Closure.

Recommendations - this category was based on the feasibility of the technology in question to achieve Type B Closure according to the screening process criteria described above for the SITE.

Please refer to *Table 1, Initial Screening of Alternative Treatment Technologies Review and Comparison,* for the SITE, which is attached.

The technologies retained for further evaluation were Steam Injection/Vapor Extraction, Soil Vapor Extraction/Air Sparging, Bioventing, Free Product Recovery, and Ground Water Pump and Treat.

4.0 DETAILED EVALUATION OF ALTERNATIVES

The Traverse Group performed a detailed evaluation of the technology alternatives retained after initial screening using the more comprehensive list of parameters outlined by MDNR. The short-listed technologies were compared based on the identified site conditions (affected area, geology, site infrastructure), engineering considerations (contaminants of concern, technical feasibility, innovative technologies, capital and life cycle costs, risk based cleanup criteria) and client concerns (public relations, regulatory impact and remaining risk). An additional client concern was the need to minimize disruptions at the site during construction. The facility is routinely very active. Estimated capital costs, operation and maintenance costs, and estimated project durations were assigned to each technology. The presence of recoverable product at this site added additional cost to the remediation since most of the technologies examined do not work well in the presence of free product.

The following are brief descriptions of each short listed technology alternatives.

► *Steam Injection/Vapor Extraction* is a technology originally employed for oil well production enhancement. Injecting steam at low pressure into the hydrocarbon-affected areas heats the affected soil and ground water to volatilize lighter hydrocarbons, and decrease the viscosity of heavier hydrocarbons. This increases the mobility of the hydrocarbons, as well as increasing the total recovery rate. As expected, the technology is energy intensive.

► *Soil Vapor Extraction/Air Sparging* is a widely applied technology for removing petroleum hydrocarbons from the soil and ground water. Air is injected into the ground water below the hydrocarbon-affected saturated interval, and by vaporization, the hydrocarbons are transferred to the vapor phase and transported to the ground water surface. Upon reaching the unsaturated zone, the soil vapor extraction system takes over to collect the hydrocarbon vapors for treatment. Introducing excess oxygen to the subsurface will also stimulate the bacteria in the saturated and unsaturated soil enhancing biodegradation of the hydrocarbons.

► *Bioventing* is a relatively new technology employing the use of air sparging to remove the hydrocarbons from the affected ground water. As with SVE/AS, the vapors are transferred to the unsaturated soil zone. However, in this case the vapors are bioremediated in place by the indigenous bacteria in the soil rather than collecting the vapors with an SVE system.

► *Free Product Recovery* is a partial remedy for the site. Because soil and ground water remediations are carried to such low contaminant levels, it is most cost effective to recover as much concentrated product as possible in the early stages of the cleanup.

► *Ground Water Pump and Treat* is also a partial remedy for the site. The technology by itself will not clean up the affected unsaturated soil, and will only clean up the saturated soil over a very long period of time. It is effective, however, in increasing the efficiency of the product recovery system by creating a cone of depression in the water table into which the free product can migrate and be collected. It will also control the migration of dissolved hydrocarbons in the ground water. Finally, the previously saturated soil in the cone of depression will be available to the soil vapor extraction technologies for final cleanup.

All of the technology alternatives examined have been proven to be effective in remediating petroleum hydrocarbons. A bacterial assay of the soil at the site has confirmed the existence of hydrocarbon degraders in the soil at the site. The soil conditions are adequate for all of the short listed technologies to be effective. Except for the ground water pump and treat alternative, each of the technologies permanently and significantly reduce the volume and toxicity, by way of destruction or treatment. Mobility of contaminants may be slightly increased under alternatives utilizing sparging however, this risk will abe balanced by proper monitoring of both the vapors in the unsaturated zone and the ground water. While the remedial technology design is flexible, integrating the remedial design with the infrastructure at the site will be challenging, especially the Allen's Creek Drain. All of the technologies described above will entail installation of some system components below ground causing some disruption of normal SITE operations during system installation.

Table 2 is a detailed evaluation containing more specific positive and negative factors for each short listed technology as it applies to the site.

Estimated costs for implementing the various technologies were compiled and compared. Capital and operation and maintenance (O&M) costs were estimated, as well as estimated project lives. The Net Present Worth for each technology was calculated. The results of the analysis are presented in Table 3. The various cost factors, capital cost, O&M cost, project life, and interest rates, were varied as a sensitivity analysis to see which factor most influenced the Net Present Worth of each alternative. The sensitivity analysis revealed that the overall project cost was most affected by estimated project duration, followed by O&M costs. This is expected for longer term projects, those lasting over four to five years. In this case, the costs for free product recovery and ground water pump and treatment were added to all other technologies because they are not effective in a stand alone mode when free product is present.

Please note that all costs and project durations are estimates. At this site, the secondary soil and ground water treatment system may only be installed and operated after completing product recovery. The Net Present Worth for Steam Injection/Vapor Extraction, SVE/Air Sparging, and Bioventing include installation and two year's operation of the product recovery system. This scenario results in an ultimate project life of approximately five years. In the cases of the vapor extraction technologies, the soil venting portions could be installed at the outset to complement the product recovery efforts, with the air or steam injection portions activated at the completion of product recovery. This could conceivably decrease the project life.

5.0 SELECTED ALTERNATIVE

The selected alternative is a combination of technologies. Product recovery will be continued and expanded to reduce the current volume of free product in the soil to prevent migration and prepare the soil and ground water for the secondary treatment and ultimately decreasing the life of the cleanup project. The secondary treatment technology selected is SVE/Air Sparging. While the costs of bioventing appear more desirable when compared to SVE/Air Sparging, it was decided that SVE/Air Sparging was a more technically acceptable alternative.

Table 1 - INITIAL SCREENING OF ALTERNATIVE TREATMENT TECHNOLOGIES - REVIEW AND COMPARISON
City of Ann Arbor - Parks and Recreation Garage

Remedial Action	Technology[1]	Comments[2]	Recommendations[3]
NO ACTION	—	current site conditions above Type B Cleanup Criteria will remain	eliminate from further consideration
LIMITED ACTION (Type C)	Restricted Access and Institutional Controls	current site conditions above Type B Cleanup Criteria will remain	eliminate from further consideration
PHYSICAL CONTAINMENT	Surface Water Diversion, Capping, and Slurry Wall	potential off-site migration of contaminated ground water and free product due to surface run-off and subsurface transport phenomena will be reduced, however, current site conditions above Type B Cleanup Criteria will remain, too many structures in the affected area, no underlying clay layer to key into, long term monitoring requirements	eliminate from further consideration
In Situ TREATMENT			
Physical Methods	Steam Injection/Vacuum Extraction	volatilized hydrocarbons must be treated, steam injection delivery is difficult, reduced time period to treat soil, installation of system difficult due to high site activity, cost prohibitive, will enhance product recovery	retain for further evaluation
	Soil Vapor Extraction/Air Sparging	volatilized hydrocarbons must be treated, accelerated period to treat both soil and ground water, also demonstrated as effective for free product removal	retain for further evaluation
	Soil Vapor Extraction	volatilized hydrocarbons must be treated, long time period to treat soil, does not treat ground water effectively, not effective for removing free product	eliminate from further consideration
	Free Product Recovery	effectively reduces available hydrocarbons that migrate through soil and leach into ground water, does not reduce contamination to below Type B criteria, does not directly improve ground water quality, already have a recovery system in place which can be expanded	retain for further evaluation if combined with other technologies
	Solidification/Stabilization	reduces mobility of contaminants, however, contaminants still remain at site, unproven technology for organic contaminants, does not remediate ground water or free product	eliminate from further consideration
	Electroacoustic Decontamination	unproven technology, cost prohibitive	eliminate from further consideration
	Soil Vitrification	contaminants melted and fixed w/some volatilization, installation of system not feasible due to high site activity above and below grade, extremely cost prohibitive, does not remediate ground water, secondary effects of free product destruction difficult to predict/control	eliminate from further consideration

[1]Within these general technologies, specific processes may exist that are highly innovative and would be evaluated as a part of the detailed evaluation of alternative remedial technologies.
[2]Comments were directed at the possible potential for Type B Closure for each general technology.
[3]Recommendations were made based on whether the possibility existed for the technology in question to achieve Type B Closure according to the screening process criteria at the SITE.

Table 1 - INITIAL SCREENING OF ALTERNATIVE TREATMENT TECHNOLOGIES - REVIEW AND COMPARISON
City of Ann Arbor - Parks and Recreation Garage

Remedial Action	Technology[1]	Comments[2]	Recommendations[3]
Chemical Methods	Soil Flushing	generates liquid waste stream, requires hydraulic and chemical control of subsurface and treatment of aqueous waste stream, demonstrating hydraulic control will be difficult and costly due to Allen's Creek Drain, permitting difficult, soil-type dependent, liquid waste disposal costs, does address free product recovery	eliminate from further consideration
	Chemical Treatment - Oxidizers	strong oxidizers convert hydrocarbons to non-hazardous compounds, oxidizers dangerous to handle, demonstrating hydraulic control will be difficult and costly due to Allen's Creek Drain, permitting difficult, affects of strong oxidizers on free product unknown	eliminate from further consideration
Biological Methods	Soil Vapor Extraction/Air Sparging	requires vapor treatment, does not require discharge permit if closed loop, does address free product	retain for further evaluation
	Bioventing	does not require treatment of vapors, regulatory approval may be difficult, does address free product	retain for further evaluation
	Aerobic Microbial Degradation (Bioremediation)	aerobic oxidation process for removal, in unsaturated soil requires long time period to achieve cleanup, system reliability low, biological degradation rates are site specific and may not be acceptable, not effective on free product, active required hydraulic control, passive not feasible because of the presence of free product	eliminate from further consideration
***Ex Situ* TREATMENT**			
All ex-situ technologies, except Pump and Treat, require excavation, which do not address ground water contamination or free product removal, would be difficult to perform because of heavy traffic in the target area, and possibly produce unsafe vapor emissions			
Physical Methods	Landfill Disposal	potential long-term liability, short time-frame to achieve cleanup, can impact site production, presence of free product may classify excavated soil as hazardous waste	eliminate from further consideration
	Incineration	poor public perception, limited area to set up equipment, possible emissions concerns, cost prohibitive , short time-frame	eliminate from further consideration
	Low Temperature Thermal Desorption	possible emissions concerns, limited area to set up equipment, short time-frame	eliminate from further consideration

[1]Within these general technologies, specific processes may exist that are highly innovative and would be evaluated as a part of the detailed evaluation of alternative remedial technologies.
[2]Comments were directed at the possible potential for Type B Closure for each general technology.
[3]Recommendations were made based on whether the possibility existed for the technology in question to achieve Type B Closure according to the screening process criteria at the SITE.

Table 1 - INITIAL SCREENING OF ALTERNATIVE TREATMENT TECHNOLOGIES - REVIEW AND COMPARISON
City of Ann Arbor - Parks and Recreation Garage

Remedial Action	Technology[1]	Comments[2]	Recommendations[3]
	Pump and Treat	provides hydraulic control, addresses ground water contamination, water may or may not need treatment, depending on discharge requirements, long-term system operation, could be coupled with product recovery system	retain for further evaluation
Chemical Methods	Soil Washing	generates liquid waste stream, hydraulic and chemical control available, still requires treatment of aqueous waste stream, soil-type dependent, liquid waste disposal costs, limited area to set up equipment	eliminate from further consideration
	Solvent Extraction	solids are mixed with non-aqueous extraction fluid and separated, generates liquid waste stream, more control in above-ground reactor as compared to *In Situ*, soil-type dependent, liquid waste disposal costs, limited area to set up equipment	eliminate from further consideration
Biological Methods	Aerobic Microbial Degradation (Bioremediation)	better microbial ecology control in above-ground bioreactors, long time period to treat soil meaning higher life cycle costs, biological degradation rates are site specific, site constraints, limited area to set up equipment	eliminate from further consideration

[1]Within these general technologies, specific processes may exist that are highly innovative and would be evaluated as a part of the detailed evaluation of alternative remedial technologies.
[2]Comments were directed at the possible potential for Type B Closure for each general technology.
[3]Recommendations were made based on whether the possibility existed for the technology in question to achieve Type B Closure according to the screening process criteria at the SITE.

***Table 2* - DETAILED EVALUATION OF ALTERNATIVE TREATMENT TECHNOLOGIES**
City of Ann Arbor - Parks and Recreation Garage

Remedial Action	Technology	Positive Factors	Negative Factors
***In Situ* TREATMENT**			
Physical Methods	Steam Injection/Vacuum Extraction	Reduced time to treat soil and ground water, will enhance product recovery	Volatilized hydrocarbons must be treated, requires an Air Use Permit, steam delivery is difficult, costly due to energy consumption for steam generation
	Soil Vapor Extraction/Air Sparging	Accelerated period to treat both soil and ground water, may assist free product removal, simple and reliable mechanical components	Volatilized hydrocarbons must be treated, requires an Air Use Permit. If not closed loop, free product should be collected before installating and operating sparging.
	Free Product Recovery	Effectively reduces available hydrocarbons that migrate through soil and leach into ground water, already have product recovery system in place which can be expanded	Does not reduce contamination to below Type B criteria, does not directly improve ground water quality
Biological Methods	Soil Vapor Extraction/Air Sparging	Accelerated period to treat both soil and ground water, may assist free product removal, simple and reliable mechanical components	Volatilized hydrocarbons must be treated, requires an Air Use Permit. If not closed loop, free product should be collected before installating and operating sparging.
	Bioventing	Does not require vapor treatment, simple and reliable mechanical components	Regulatory approval may be difficult, may require an Air Use Permit, free product should be collected before installation and operation
***Ex Situ* TREATMENT**			
Physical Methods	Pump and Treat	Provides hydraulic control, addresses ground water contamination, simple and reliable, could be integrated with product recovery system	Water may or may not need treatment, depending on discharge requirements, long-term system operation and monitoring

[1]Within these general technologies, specific processes may exist that are highly innovative and would be evaluated as a part of the detailed evaluation of alternative remedial technologies.
[2]Comments were directed at the possible potential Type B Closure for each general technology.
[3]Recommendations were made based on whether the possibility existed for the technology in questions to achieve Type B Closure according to the screening process criteria at the Site.

***Table 3* - COST EVALUATION**
City of Ann Arbor - Parks and Recreation Garage

Technology	Capital Costs	O&M Annual Costs	Closure Cost	Project Life** (years)	Net Present Worth	Interest Rate
Steam Injection/Vapor Extraction	$93,550	$124,800	$22,500	2.0	$502,000*	5%
SVE/Air Sparging	$65,600	$102,000	$22,500	3.0	$421,000*	5%
Bioventing	$56,400	$57,200	$22,500	3.0	$302,000*	5%
Free Product Recovery	$18,000	$20,650		1.5	$47,000	5%
Pump and Treat	$35,200	$90,600		2.0	$204,000	5%

*The cost for implementing the free product recovery system has been added into the estimated total project cost.
** Estimated project life is based on subsurface investigation results and should be used for comparative purposes only. Further refinement of project life estimates should be completed as part of the final design.

***Table 4* - ESTIMATED EXPENDITURE SCHEDULE**
City of Ann Arbor - Parks and Recreation Garage

	1st year	2nd year	3rd year	4th year	5th year	6th year	Total
Capital	$53,200[1]		$65,600[1]				$118,800
O&M		$20,650[2]	$20,650[2]	$102,000[2]	$102,000[2]	$124,500[3]	$369,800
Total	$53,200	$20,650	$86,250	$102,000	$102,000	$124,500	$488,600[4]

EXECUTIVE SUMMARY

The release of gasoline and diesel from two underground storage tanks (UST) at the City of Ann Arbor's Parks & Recreation Garage, located at 415 West Washington Street in Ann Arbor, Michigan has impacted soil and groundwater with petroleum at the site. Utilizing the results of site investigation and contaminant chafacterization completed by The Traverse Group, Inc. (TGI) and the results of additional site investigation and pilot testing of several remediation technologies by NTH Consultants, Ltd. (NTH), we have prepared this corrective action plan (CAP) for the impacted soil and groundwater at the site. This report includes a brief review of previous studies; information regarding the additional site investigation by NTH; background information including site geology, hydrogeology, and contaminant distribution; a description of the pilot test methods and results; and a conceptual remedial design. Information provided in this document will be used to prepare the project construction drawings.

Our site investigation included drilling six test borings; installing three monitoring wells and three piezometer nests; and the completion of a chemical testing program of groundwater and soil samples.

Based on TGI and NTH investigations, the site geology across the zone of impacted soil and groundwater consists of the following layers from top to bottom: Fill; fine to medium sand; moist black peat; and wet fine to coarse brown sand. Both investigations indicated that the groundwater table is relatively level across the site typically at 792.3 feet in August 1995 (NTH) and at 793.4 feet in July 1993 (TGI). Based on this information, it appears that little of the impacted sandy soils below the peat layer are unsaturated. Based on the results of TGI investigation and NTH additional investigation, we estimated the extent of impacted groundwater and soils in accordance with Tier One Residential Cleanup Criteria.

Our pilot testing program evaluated several remediation technologies including pump and treat, soil vapor extraction (SVE), bioventing (BV), and air sparging (AS). Using the pilot study data, we

estimated the hydraulic properties of the soils and collected information regarding the response of the impacted soils to the different remediation methods.

Based on available subsurface information and results of our pilot testing, we developed a conceptual remedial system for the impacted soils and groundwater. The proposed system consists of the following:(1) three dewatering/product recovery wells; (2) three SVE/BV well nests and an SVE trench; (3) three AS wells; and (4) an above ground treatment system. The dewatering/ product recovery and AS wells will be used to remedy the impacted groundwater. The SVE/BV wells will be installed in pairs with one addressing the unsaturated zone above the peat layer and the other addressing the zone below the peat. There will be no saturated zone above this peat layer due to the dewatering operation.

The above-ground treatment system for the liquid phase will include oil-water separation for product recovery followed by an air stripper and carbon polishing. For the vapor phase, the above ground treatment system consists of a vapor phase carbon treatment. The above-ground treatment system will be housed in a winterized shed located in the courtyard immediately adjacent to the garage and former tank area. After securing the required disposal permits, treated water may be discharged in Allen Creek.

Review of the previous work conducted at the site and earlier discussions with the City indicated that the site should be remediated to Type B cleanup criteria. However, since the soil and groundwater criteria have recently changed based on PA 451 amendments (Part 213, PA 451), the cleanup goals used to develop this final CAP followed the recently published MDNR Tier One Risk Based Corrective Action (RBCA) soil and groundwater cleanup criteria.

1.0 INTRODUCTION

The City of Ann Arbor (City) reported a release from two 6,000-gallon underground storage tanks (USTs) that were used for storage of gasoline and diesel fuel located at the Parks and Recreation Garage, 415 West Washington Street, Ann Arbor, Michigan, (see Plate 1). The tanks were owned and operated by the City. The USTs were removed from the site on March 20, 1992.

The City contracted the services of The Traverse Group, Inc. (TGI) to characterize the site geology and hydrology, to assess the nature and extent of contamination and to conduct a preliminary feasibility analysis of viable remedial alternatives for site cleanup. TGI completed numerous boreholes and monitoring wells and collected and analyzed soil and groundwater samples. In addition, they also installed a free product recovery system to remove free-phase product previously detected at the site. The results of these activities are reported in the following reports:

- 45-Day Report, dated April 17, 1992,
- Site Investigation Report for an Underground Storage Tank Release, dated April 15, 1994, and
- Feasibility Study, dated April 15, 1994.

Subsequently, the City retained NTH Consultants, Ltd., (NTH) in December, 1994 to complete the design, construction and startup of a remedial system for the site and also to operate and maintain the system. The results presented in previous TGI reports provided the basis for NTH's approach.

NTH has reviewed the previous reports for the site prepared by TGI, completed additional site investigation, designed and implemented a pilot study at the site and developed a remedial

alternative for site cleanup. The results of NTH's activities are reported in this Corrective Action Plan (CAP).

Consistent with the appropriate and applicable regulations in 1994 the City recommended that the site be remediated to MDNR Type B soil and groundwater criteria. However, since the soil and groundwater criteria have recently changed, The City has agreed to develop this final CAP based on cleanup goals consistent with newly promulgated and some what similar MDEQ RBCA Tier I soil and groundwater cleanup criteria.

2.0 ADDITIONAL SITE INVESTIGATION

2.1 PURPOSE AND SCOPE

The purpose of the additional investigation was to better characterize the source area soil and groundwater conditions to facilitate design and implementation of both the pilot study and the full-scale remediation system. Specific tasks of the investigation included:

- Drilling and Soil Sampling - A total of 6 soil borings were completed in and around the UST source area, (see Plate 2). Soil samples were collected for classification and analysis. The borings were used for determining soil types and for the installation of test wells and piezometers.

- Installation of Test Wells and Piezometers - Three test wells and three piezometer nests were installed for the additional investigation and for the pilot study. The three test wells consist of a 4-inch diameter soil vapor extraction/recovery well, a 4-inch diameter air sparging well, and a 2-inch bioventing well nest. Each of the three piezometer nests contains four 1-inch diameter piezometers.

- Analytical Testing - Analytical testing for soil and groundwater samples included BTEX and MTBE (Method 8020), PNAs (Method 8310), and Lead (Method 7421).

- Evaluation - The data from the additional investigation has been compiled and evaluated as presented later in this report.

2.2 INVESTIGATIVE METHODS

2.2.1 Drilling and Soil Sampling

Six test borings (TB-1 through TB-6) were drilled and sampled by Geo Tek, Inc. of Lowell, Michigan under the technical supervision of NTH personnel on April 6, 7, 10, 11, and 12, 1995. The test borings were also used for the installation of test wells and piezometers for the pilot study. The approximate locations of the borings are shown on Plate 2. Logs of test borings, wells, and piezometers are included in Appendix A of this document.

The test borings were advanced to depths ranging from 11.5 to 30.0 feet with a trailer mounted CME-45 rotary drill rig equipped with 4 -1/4 inch inside diameter hollow stem augers. An NTH field technician maintained a log of each boring which included a description of the soil samples collected, information on groundwater conditions encountered during drilling and other pertinent data. Soil samples were collected at 2.5 and 5.0 foot depth intervals using a 2- inch outside diameter split barrel sampler according to ASTM D-1586. Information from the standard penetration test, namely the standard penetration resistance (N) and the blow counts were recorded on the log for each boring.

After opening the split barrel soil sampler and describing the contents, a representative soil sample was placed in laboratory-supplied glass containers for chemical testing and another portion of the soil sample was collected in a plastic storage bag with a sealable top for field headspace testing (screening). The samples collected in storage bags were allowed to reach approximately 70 degrees Fahrenheit and then the approximate concentration of total volatile organic compounds (VOCs) in the air-space inside the bag was measured with a portable photoionization (HNU) meter. The sample "screening" was performed by inserting the probe tip of the HNU meter into a small opening in the seal of the plastic storage bag. The HNU response to the headspace gas inside the bag was then observed and recorded on the field log. Soil samples for chemical testing were placed in iced coolers and were transported to an analytical laboratory using standard Chain-of-Custody procedures.

Prior to arrival on site and between borings, the drilling and sampling equipment were steam cleaned to minimize the potential for cross contamination of samples. In addition, the split barrel sampler was decontaminated between successive samples at each boring.

Soil and groundwater conditions encountered in the test borings have been evaluated and are presented in the form of individual Test Boring Logs and are attached as Figures 1 through 6 in Appendix A. Our General Notes describing nomenclature used on the logs is also attached as Exhibit A. The test boring logs have been prepared on the basis of field classification of the soils encountered. The stratification lines shown on the logs represent the approximate boundary between soil types, but the actual transition may be more gradual. The boring logs also present information relating to soil sample data, standard penetration test results, groundwater conditions observed in the borings, personnel involved and other pertinent data.

Upon completion of soil sampling, test boring Nos. TB-1 through TB-6 were then over-drilled using 6 1/4 or 8 1/4 inch inside diameter hollow stem augers to allow for test well or piezometer nest installation.

2.2.2 Installation of Groundwater Recovery/Injection Test Wells

An Air sparge well (AS-1), bioventing well (BV-1) and soil vapor extraction/recovery well (SVE-1) were installed in test boring Nos. TB-1, TB-3, and TB-4, respectively. These wells were installed for air sparging, groundwater pump testing, soil vapor extraction and bioventing tests for the pilot study and also can serve as groundwater monitoring wells. Components of each well are described below.

- AS-1 consists of a 4-inch diameter by 5 foot long PVC screen (0.010 inch slot) flush-coupled to 4-inch diameter PVC riser pipe, (see Figure 7 in Appendix A);

- BV-1 consists of a 2-inch diameter by 5 foot long PVC screen (0.010 inch slot) and one 2-inch diameter by 4 foot long PVC screen (0.010 inch slot), each flush coupled to 2-inch

diameter PVC riser pipe. The biovent well screens are set such that they are nested, (see Figure 8 in Appendix A);

- SVE-1 consist of a 4-inch diameter by 15 foot long PVC screen (0.010 inch slot) flush-coupled with 4-inch diameter PVC riser pipe, (see Figure 9 in Appendix A);

Following completion of over drilling with 6 -1/4 and 8 - 1/4 inch ID augers, well assemblies for AS-1, BV-1, and SVE-1 were lowered in the bottom of the respective borings through the hollow stem augers (completed well depths range from 12.0 to 23.6 feet). For each well and in accordance with specific well design, various annular space was then filled with washed silica sand, followed by hydrated bentonite pellets and cement-bentonite grout. Each well head was secured with a steel protective cover.

Information regarding well installation procedures and materials used are presented in the form of individual well logs, presented as Figures No. 7 through 9 in Appendix A.

The top of the casing elevations were surveyed to the nearest 0.01 foot using conventional surveying techniques. NTH personnel used the top of casing elevations of previously installed wells for benchmark reference to determine the top of casing and ground surface elevations of recently installed piezometers and test borings. Monitoring wells installed previously by TGI were surveyed by registered surveyors to determine top of casing elevations correlated with USGS benchmark datum to the nearest 0.01 foot.

2.2.3 Installation of Piezometer Nests

Following over drilling with the 6 1/4 or 8 1/4 inch hollow stem augers, nested piezometers P-1, P-2 and P-3 were installed in test boring TB-2, TB-5 and TB-6, respectively. Each nested piezometer contains four piezometers. The piezometers are constructed of one inch diameter by 1-foot or 2-foot long PVC screens (0.010 inch slot) flush coupled to one inch diameter PVC riser

pipe. In each piezometer nest, the screen tips are set at 5, 10, 15 and 20 feet below existing ground surface. The annular space around each screen contains washed silica sand. The well screens within each

piezometer nest are separated by bentonite seals. Each piezometer nest was completed with a 1-foot thick concrete pad and a steel protective cover at the ground surface. Piezometer nest construction details are provided in Figures 10 through 12 in Appendix A.

2.2.4 Groundwater Sampling and Analysis

On September 4, 1995 NTH personnel collected groundwater samples from recently installed piezometers P-1, P-2 and P-3 (9'-10' screened interval) and from four previously installed monitoring wells MW-3, MW-6, MW-8 and MW-11. The piezometers were sampled using a peristaltic pump and clear PVC tubing (a new section of tubing was utilized for each sample). The monitoring wells were sampled using bottom filling, disposable HDPE bailers. Prior to sampling, each piezometer or well was purged of at least 3 well volumes of water. The well development and purge water was temporarily stored on-site in DOT approved metal containers awaiting proper disposal.

The collected samples were placed in laboratory supplied sample bottles with appropriate preservatives. The sample bottles were then placed in a field cooler with ice and were transported to National Environmental Testing, Inc. (NET) in Auburn Hills, Michigan for chemical testing under standard Chain-of-Custody protocol. The groundwater samples collected from the wells were analyzed for the presence of BTEX, MTBE, PNAs and dissolved lead using the proper EPA SW-846 Test Methods. The portion of each groundwater sample analyzed for dissolved lead was filtered at the time of sampling by NTH personnel using 0.45 micron disposable filters. The results of the groundwater chemical testing are provided on Table 2 in Appendix B. The laboratory analytical reports and laboratory QA/QC data are also provided in Appendix B.

2.2.5 Analytical Testing of Soil Samples

A total of fourteen soil samples (3 from TB-1; 4 from TB-2; 2 from TB-3; 2 from TB-4; 3 from TB-5) collected from the test borings for this investigation were analyzed by NET for the presence of BTEX, MTBE, PNAs and total lead using the proper EPA SW-846 Test Methods. No samples from TB-6 were analyzed due to TB-6's proximity to already tested TB-1 and TB-3. The chemical testing data is summarized on Table 1 in Appendix B. Laboratory data reports and laboratory QA/QC data are also provided in Appendix B.

3.0 SITE GEOLOGY, HYDROGEOLOGY, AND CONTAMINANT DISTRIBUTION

3.1 SITE GEOLOGY

Based on site investigations completed by TGI and NTH, the general subsurface soil conditions observed across the zone of petroleum impacted soil and groundwater are as summarized in the following table. The table was developed from logs of test borings completed during on-site subsurface investigations.

DEPTH(feet)	SOIL DESCRIPTION
0.0 to 0.5	Asphalt/Concrete
0.5 to 4.0	Fill - Mixed sand, stone, clay, cinder and brick debris
4.0 to 6.0	Native - Fine to medium silty brown sand
6.0 to 8.0	Native - Moist organics, black peat
8.0 to 46.0	Native - Wet, fine to coarse brown sand

As shown in the above table, at approximately 6 to 8 feet below ground level (bgl), the soil is primarily black organic peat. The elevation of the bottom of this layer ranged from 790.25 feet to 792.50 feet. The peat layer top and bottom elevation contour maps are presented on Plates 3 and 4, respectively. Below the peat layer, sand with gravel extends to depths of more than 46 feet bgl based on review of TGI's investigation report. A well-cemented sand unit or hardpan was encountered at 46 feet bgl in the northwest portion of the site per TGI.

3.2 SITE HYDROGEOLOGY

Based on information reported by TGI, the water table along the site varied from a depth of 5.5 to 8 feet bgl during the site investigation. Based on Figure 3 of TGI's 1994 report, the water table elevation ranged from 793.00 feet to 793.65 feet between May 14 and July 13, 1993. Based on

groundwater elevations collected by NTH on September 4, 1995, the groundwater elevation across the site ranged from 791.31 feet to 792.41 feet. Using September 1995 groundwater information, we prepared a groundwater elevation contour map presented as Plate 5.

The elevation of groundwater relative to the bottom of the peat layer is expected to pose certain unique challenges for the remediation. Since the groundwater elevation occurs below the peat layer at some locations, the impacted soils (unsaturated zone) may extend below the peat layer. Therefore, the peat layer hydraulically divides the unsaturated zone into three sub-zones; the peat layer and a sub-zone above and below the peat layer. This may require the installation of separate remediation sub-systems for each sub-zone.

Different monitoring wells were measured by TGI at different time spans in order to establish the ground-water flow direction and the hydraulic gradient. Following is the summary of the readings measured at the site by TGI:

GROUNDWATER FLOW DIRECTION DATA (FROM TGI)			
Date	**Wells Measured**	**Direction of Groundwater Flow**	**Hydraulic Gradient (observed in ft/ft)**
07/01/92	MW-4, MW-5, MW-6	N 75° 22" W	0.00220
05/14/93	MW-5, MW-6, MW-7	N 13° 49" W	0.00141
07/13/93	MW-5, MW-6, MW-7	N 11° 28" W	0.00141

The site lies in a 100- year flood plain within the Allen Creek drainage basin. Allen Creek Drain serves as the main storm sewer for the City of Ann Arbor. The main branch of Allen Creek Drain enters the site from the south heading north, turns northwest and then again turns towards the north in the middle of the site.

3.3 CONTAMINANT DISTRIBUTION

During previous and current investigations, the soil and groundwater samples were analyzed for indicator parameters of gasoline; Benzene, toluene, ethyl benzene and xylene (BTEX), methyl tert butyl ether (MTBE), polynuclear aromatics (PNAs), and lead. The following methods were applied for the analysis:

- BTEX and MTBE — Method 8020
- PNAs — Method 8310
- Total Lead — Method 7421 (furnace)

Based on the results of this testing, we estimated the extent of the impacted soil and groundwater in accordance with Tier 1 Residential Cleanup Criteria.

The concentrations of VOCs and PNAs detected in the soil and groundwater samples tested by NTH are summarized in Tables 1 and 2 in Appendix B. The concentrations of VOCs and PNAs detected in the soil and groundwater samples tested by TGI are summarized in Tables 3 and 4 in Appendix B. Comparison of the parameter concentrations with the Part 213 Tier I criteria, also summarized in Tables 1 through 4, reveals several compounds which exceed one or more criteria.

3.3.1 Extent of Petroleum Impacted Soil

During the NTH investigation, as shown on the boring logs provided in Appendix A, positive field screened HNu readings were reported for most of the collected soil samples. Typically, the HNU values ranged from 50 ppm to 400 ppm in the vadose zone soils and then decreased significantly, ranging from <1 ppm to 5 ppm, with increasing depth.

No regulated substance was detected in the soil samples analyzed at a concentration which exceeded Tier I direct contact criteria, except for a single sample collected from a depth of 5.0 feet below ground surface (bgs). This sample, collected from test boring TB-5, contained

benzo(a)pyrene at 1800 μg/kg, which slightly exceeds its Tier I direct contact criterion of 1400 ug/kg. However, the benzo(a)pyrene concentration of 1800 ug/kg does not exceed the Tier I soil threshold for leachate testing for groundwater protection, that is, 3700 ug/kg.

In contrast however, several compounds were detected in the soil with concentrations exceeding the Tier I leachate threshold levels, including benzene, ethyl benzene, xylenes, and acenaphthalyene. In addition, naphthalene was detected in a single soil sample (AH1 at 4-6 feet bgs) at 5600 ug/kg, which slightly exceeds the Tier I leachate threshold of 5500 ug/kg. Benzene was detected in several soil samples with levels exceeding the leachate threshold criterion of 100 ug/kg, including subsurface samples from AH-1, MW-8, AH-4, MW-10, TB-1, TB-2 , TB-3, and TB-4. Ethyl benzene was detected with concentrations in excess of the leachate threshold in subsurface soil samples from MW-8, AH-4, TB-1, TB-2, TB-3, TB-4, and TB-5. Xylenes were detected with total concentrations exceeding the leachate threshold in samples collected from MW-8, TB-3, and TB-4. Although MTBE was not detected in concentrations exceeding Tier I direct contact criterion, the levels of detection reported for the analyses were too high to determine compliance with the leachate threshold level. Acenaphthalene was detected at 3700 ug/kg in a subsurface soil sample obtained from AH-1; this concentration exceeds the leachate threshold level of 1400 ug/kg.

Review of previous chemical data collected east of the Allen Creek Drain did not reveal any concentrations in excess of the newly promulgated RBCA Tier I criteria. Based on this, no soil remediation is planned east of the Allen Creek Drain.

Using benzene as an indicator parameter, an approximate extent of the petroleum impacted soil in excess of MDNR's RBCA Tier I (leaching to groundwater) soil cleanup criteria is shown on Plate 6, Extent of Soil Contamination Plan. Plate 6 was based on the previous data collected by TGI and recent chemical data collected by NTH during the pilot study.

Samples collected from boring AH17-1, and AH17-2 located south and east of the former tank area, detected PNA (total) concentrations at shallow depths. However, these PNA concentrations appear are below the respective Tier I cleanup criteria, and will not require remediation.

3.3.2 Extent of Petroleum Impacted Groundwater

Comparison of the results of groundwater analysis with the Tier I criteria provided in Tables 2 and 4 reveals that the BTEX compounds, MTBE , and several PNA compounds were present in one or more groundwater samples with concentrations exceeding one or more of the Tier I groundwater criteria. Benzene was detected with levels exceeding Tier I criteria in water samples collected from MW-1, AH-1, AH-2, AH-771, MW-6, MW-8, AH-4, P-1, P-2, P-3, MW-6, and MW-11. It is noted that water samples which contained elevated benzene from MW-8 and AH-4 were collected during drilling using a screened auger. Consequently, the results may be skewed by the presence of suspended particulates. When MW-8 was resampled following development and purging, benzene was not detected, nor were any other analytes.

Toluene was detected with levels above Tier I groundwater criteria in samples collected from MW-1, MW-8, AH-4, P-1, and P-2. Ethyl benzene was detected with increased concentrations in samples collected from MW-1, AH-1, MW-6, MW-8, AH-4, MW-11, P-1, P-2, P-3, and MW-6, while xylenes were detected in MW-1. AH-1, AH-2, AH-762, MW-6, MW-8, AH-4, MW-11, P-1, P-2, P-3, and MW-6. While not analyzed for all water samples, MTBE was detected in P-1 with a concentration exceeding Tier I groundwater criteria.

One or more PNAs were detected with concentrations exceeding the Tier I groundwater criteria from the following locations; MW-1, AH-1, AH-2, MW-6, MW-8, and AH-4. The PNAs detected included naphthalene, acenaphthylene, acenaphthene, phenanthrene, benzo(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, dibenzo(a,h)anthracene, benzo(ghi)perylene, and indeno(1,2,3-cd)pyrene.

Review of the previous data collected by TGI on the east site of the Allen Creek Drain did not indicate the presence of petroleum impacted groundwater in excess of the MDNR RBCA Tier I cleanup criteria, thus, no remedial activities are planned in this area.

Based on review of the data collected by TGI and NTH, the extent of the petroleum impacted groundwater was generally delineated. The maximum depth of contamination was detected near auger probe location AH-4 at an approximate depth of 30 feet bgs. Using benzene as an indicator parameter, the approximate lateral extent of petroleum impacted groundwater is illustrated in Plate 7, Extent of Groundwater Contamination Plan.

3.3.3 Free Product Distribution

Free product was detected during TGI's investigation in MW-1 and MW-10. In March 1993, the thickness of the product in MW-1 was approximately 33 inches. In June 1993, a free product removal system was installed by TGI in MW-1. Due to the installation of the product removal system, accurate measurements of the free product thickness in MW-1 is not feasible. Free product measurements by NTH in MW-10 ranged from 14.5 inches in April 1995 to 10 inches in September 1995. Free product was not detected in the remaining monitoring wells which were each checked for free product with an electronic interface probe prior to sampling in September 1995. It appears that free product has spread beyond the source area in the direction of groundwater flow. Interim free product recovery has been initiated by NTH in late 1995.

4.0 PILOT STUDIES

4.1 INTRODUCTION

A series of pilot studies was conducted at the City of Ann Arbor, 415 West Washington Street to evaluate the following remediation technologies:

- Pump and Treat (P & T).
- Pump and treat and soil vapor extraction (P&T and SVE).
- Pump and treat, soil vapor extraction and air sparging (P&T, SVE and AS).
- Bioventing (BV)

The data collected during the pilot study were analyzed to evaluate flow characteristics of groundwater or air (permeability), the rate of biological oxygen consumption in the unsaturated zone and the radius of influence of the technologies evaluated. The data from the pilot tests and the results from the analysis are presented in the following sections.

4.2 PUMP TEST

The following approach was followed in the groundwater pumping test:

- The SVE-1 well was used as the pumping well. The pumping well was pumped at five constant rates. Each succeeding rate was higher than the previous pumping rate. The pumping rates and their associated duration are shown in Table 4.1.

- The hydraulic response of the groundwater system to pumping was monitored at several locations including piezometer nests P-1, P-2, P-3 and monitoring well MW-10. These monitoring points were located at different distances and at different directions around the pumping well. At the piezometer nest locations the hydraulic response was monitored at two depths. The locations of these monitoring points are shown in Plate 2 and their distances from the pumping well, depth below ground and screened interval are included in Table 4.2. The monitoring field data including time, draw down, and pumping rate were

summarized in tables and were used to determine the aquifer hydraulic properties. These data are presented in Appendix C.

Monitoring Location	Distance From Pumping Well (feet)	Depth Below Ground (feet)	Screened Interval (feet)
Well SVE- 1	0	19.3	15
Piezometer P- 1	25	15.0,20.0	2
Piezometer P-2	12	15.0,20.0	2
Piezometer P-3	5	15.0,20.0	2
Well MW- 10	52	9.0	5

- During the execution of the pump test, three water samples, referred to as WS-1, WS-2, and WS-3, were collected from the pumping well and tested for BTEX, MTBE, PNAs, and total and dissolved lead. Sample WS-1 was collected just prior to the start of pumping operations. Samples WS-2 and WS-3 were collected at later stages during pumping operations. The results of the chemical testing for these three samples are presented in Table 2 of Appendix B and are discussed later in this section.

- The equation that describes radial flow to a pumping well was solved graphically to determine the transmissivity (T), storativity (S), and hydraulic conductivity (K) for several sets of data from the monitoring locations. Although the project site is not completely homogeneous and isotropic, this method provides a reasonable approximation for the water-bearing soils at the site. The hydraulic properties were estimated by analyzing the pump test results using Theis Method and Cooper-Jacobs method for piezometers P-1, P-2, and P-3. In addition, the radius of influence (R) was determined by plotting and analyzing the drawdown versus radial distance data for the three piezometers. These graphical solutions are included in Appendix C. The results for T, S, and K are summarized in Table 4.3. The radius of influence is discussed below.

Radius of Influence: Based on the graphical analysis of drawdown versus log radial distance for Piezometers P-1 through P-3, a representative value for the radius of influence for a well being pumped at 18.8 gpm is 114 feet.

Hydraulic Properties (water): As shown on Table 4.3, the values for hydraulic conductivity (K) range from 3.8×10^{-2} cm/sec (108 ft/day) to 7.0×10^{-2} cm/sec (198.8ft/day) with an average value of 5.4×10^{-2} cm/sec (153.9 ft/day). These values are relatively higher than the average hydraulic conductivity of 2.5×10^{-5} cm/sec reported by TGI. The transmissivity (T) ranged from 3456.0 ft^2/day to 6360.5 ft^2/day and averaged 4911 ft^2/day. The storativity (S) ranged from 1.4×10^{-4} to 1.9×10^{-4} and averaged 1.65×10^{-4}.

Concentration Of Contaminant: Based on the results of the chemical testing completed on the three groundwater samples collected from the recovery well (SVE-1), the concentration of contaminants was reduced significantly during the pumping operations. For example, the concentration of benzene in Sample WS-1 collected prior to pumping was 400 ppb. Approximately three hours after pumping, Sample WS-2 was collected and the benzene concentration of this sample dropped to 220 ppb. After 7 hours of pumping, sample WS-3 was collected and the benzene concentration in this sample dropped to 69 ppb.

4.3 SOIL VAPOR EXTRACTION TEST

In this pilot test, SVE was accompanied with pumping to draw down the water level in the well and avoid up welling as the vacuum was applied on the same well. The following approach was used in this combination pilot test:

- The SVE-1 well was pumped at two consecutive pumping rates. The pumping rates and their associated duration are shown below (total pumping duration = 255 minutes):

Fluid Pumping Rate (gpm)	Duration (minutes)
10.8	105
19.4	150

- After about 40 minutes of the start of groundwater pumping, the soil vapor extraction was started at the same well. The various air flow rates that were used are compiled in the following table:

Air Extraction Rate (scfm)	Duration (minutes)
12.3	20
14.7	65
15.1	65

- The response of the groundwater/air system was monitored at P-2 and P-3 piezometer locations. In the piezometer units occurring within the unsaturated soils, the air flow was monitored. In piezometer units occurring within the saturated soils, groundwater drawdown was monitored. At SVE-1 well, air flow and suction were monitored. The field data

collected during the test were compiled to generate tables that were used to analyze the data. These tables are included in Appendix D.

- The equations that describe radial flow to a pumping well were solved graphically to determine the transmissivity (T), storativity (S), and air conductivity (K) for several sets of data from the monitoring locations. As an approximation, we have used the graphical

solution for radial groundwater flow to a pumping well to represent radial air flow. The properties were estimated for Piezometer P-3 using Theis method and Cooper-Jacobs method. In addition, the radius of influence (R) was determined by plotting and analyzing the pressure decrease versus radial distance data for piezometers P-2 and P-3. These graphical solutions are included in Appendix D. The results of T, S, and K are summarized in Table 4.4. The radius of influence is discussed below.

TABLE 4.4

SUMMARY OF AQUIFER HYDRAULIC PROPERTIES
COMBINED SOIL VAPOR EXTRACTION AND PUMP TEST
415 WASHINGTON STREET
ANN ARBOR, MICHIGAN

Monitoring Location	Theis			Cooper Jacob		
	T (ft^2/d)	S	K (ft/d)	T (ft^2/d)	S	K (ft/d)
Piezometer P-3	256.2	4.0×10^{-1}	32.0	284.5	3.2×10^{-1}	35.6

Radius of influence: The analysis of the radial distance vs. vacuum level plot for Piezometers P-2 and P-3 resulted in the radius of influence R = 28 feet from the SVE well at time equal to 60 minutes, vacuum of 26 inches of water, and air flow rate of 14.7 scfm.

Hydraulic Properties (air in unsaturated zone): As shown on Table 4.4, the values for air conductivity ranged from 1.1 x 10^{-2} cm/sec (32.0 ft/day) to 1.2 x 10^{-2} cm/sec (35.6 ft/day) and averaged 1.2 x 10^{-2} cm/sec (33.8 ft/day). The transmissivity (T) ranged from 256.2 ft^2/day to 284.5 ft^2/day and averaged 270 ft^2/day. The storativity (S) ranged from 3.2 x 10^{-1} to 4.0 x 10^{-1} and averaged 3.6 x 10^{-1}.

4.4 AIR SPARGING TEST

This test involved the combination of three technologies: air sparging, soil vapor extraction to capture the sparged air, and groundwater pumping to control mounding that results from air sparging. The test was conducted to evaluate the optimum groundwater pumping rate, air injection rate and air extraction rates for the pilot study that can be applied for the site remediation.

- Water was pumped form the SVE-1 at 17.67 gpm and after 30 minutes of pumping, a vacuum was applied at the same well. Groundwater pumping was conducted to lower the water table and avoid up welling in the recovery well during soil vapor extraction and air sparging. After 65 minutes of the start of the test, air sparging was applied through the air sparging well (AS-1). The air injection rates and duration are summarized below

Air Injection Rate (scfm)	Duration (minutes)
1.72	60
3.85	50
6.09	40

- The response of the groundwater/air system due to the combination of pumping, soil vapor extraction and air sparging was monitored at piezometers P-1 through P-3. These piezometers were located in different directions and at different distances from the air sparging well in order to monitor the spatial response of the groundwater system. The locations of these monitoring points are shown in Plate 2, and their distance from the air sparging well are summarized in Table 4.5.

- The equations that describe radial flow to a pumping well were solved graphically to determine the transmissivity (T), storativity (S), and air conductivity (K) for data from piezometer P-2. As an approximation we have used the graphical solution for radial groundwater flow to a pumping well to represent radial air flow. In addition, the radius of influence (R) was estimated by plotting and analyzing the results of drawdown versus log radial distance. These graphical solutions are included in Appendix E. The results for T, S , and K are summarized in Table 4.6. The radius of influence (R) is discussed below.

Radius of influence: Based on the graphical analysis of pressure level vs log radial distance at time = 49 minutes and injection rate of 1.72 scfm, the estimated effective radius of influence is about 17 feet from the air sparging well.

Hydraulic Properties (air in saturated zone): As shown on Table 4.6, on the basis of the graphical analysis by applying Theis and Cooper Jacobs approaches, the air conductivity ranged from 4.6 x 10^{-3} cm/sec (13.2 ft/day) to 5.0 x 10^{-3} cm/sec (14.2 ft/day) and averaged 4.8 x 10^{-3} cm/sec (13.7 ft/day).

4.5 BIOVENTING TEST

A bioventing pilot test was conducted at the site. The purpose of the test was to determine the biodegradation rate of the gasoline-impacted soil in the unsaturated zone. A secondary purpose of this test was to determine the radius of influence of the air injected into the biovent well.

Air was continuously injected into the soil from the bioventing well BV-1 for three weeks at a flow rate of approximately 1 scfm and an injection pressure less than 2 psi. During injection and following the completion of the injection operations, the concentration of the carbon dioxide and oxygen were monitored at the bioventing well and piezometers P-1 through P-3. The results of the monitoring operations are summarized on Table 4.7. The amount of increase in carbon dioxide levels and decrease in oxygen levels provide information about the biodegradation rate of gasoline in the impacted soils.

Prior to the test, at the location of piezometers P-1 through P-3, soil oxygen gas concentrations ranged from 1 percent at the location of piezometer P-1 to 14 percent at the location of piezometer P-2 while carbon dioxide ranged from 1.5 percent at the location of piezometer P-2 to 10.5 percent at the location of piezometer P-3. The above results indicate an oxygen deficient soil due to the biodegradation occurring at the site.

Piezometers P-1 and P-3 responded to the bioventing operations. As shown in Table 4.7, following cessation of air injection operations, the concentration of carbon dioxide was increasing while the concentration of oxygen was reducing. This is an indication of gasoline biodegradation within the impacted soils. Piezometers P-1 and P-3 indicated similar soil gas oxygen and carbon dioxide levels in response to air injection. Using the data collected at Piezometer P-1 location, a biodegradation rate is determined. The soil gas oxygen level decreased from 16% to less than 1 % in the 96 hour monitoring period(6/01/95 to 6/05/95). The soil gas carbon dioxide level increased from 1% to 8% in the same period. During aerobic respiration, 3.1 lb. of oxygen is consumed per lb of hydrocarbon degraded. At an air injection rate of 1 scfm, the amount of oxygen injected into the soil is calculated as follows:

TABLE 4.7
SUMMARY OF MONITORING DATA
BIOVENTING TEST
415 WASHINGTON STREET
ANN ARBOR, MICHIGAN

Date	Sampling Time	Biovent Well		P1- at 5'		P2- at 5'		P3- at 5'		
		% O_2	% CO_2	% O_2	% CO_2	% O_2	% CO_2	% O_2	% CO_2	
5/10/95	14:00	6.5	2.5	1	4.5	14	1.5	2	10.5	Background Concentration
5/12/95	11:00	20.5	0	6.5	4.5	14	1	14.5	5	air inject
5/18/95	11:00	20.8	0	15.5	1.5	16.5	0	13.5	4.5	air inject
6/01/95	12:00	20.0	0	16	1	16.5	0.5	14.5	2	air off
6/02/95	11:00	14.5	0	7	4	13	2	13.5	4.5	air off
6/05/95	11:30	19.5	0.5	0	8	10.5	4.5	2	9	air off

1 scfm x 0.075 lbs/cf x 60 min/hr x 0.16 oxygen = 0.72 lbs/hr of oxygen.

The corresponding amount of hydrocarbon (HC) undergoing biodegradation is presented below:

0.72 / 3.1 lbs oxygen per lb of HC = 0.23 lbs/hr of HC.

The carbon dioxide levels do not indicate that all the oxygen was used for aerobic respiration so the actual amount of HC degradation is probably less than 0.23 lbs/hr.

At the degradation rate of 50% of the above calculated value, 0.12 lbs/hr of HC contamination is degraded. Using this value, the rate of HC degradation at this site due to bioventing is about 1/2 gallon of gasoline per day.

Piezometer P-2 responded to the air injection at the biovent well to a lesser degree than the other two piezometers. The soil gas measurements at the biovent well indicate that the soil at this point

of the site is no longer producing a significant rate of carbon dioxide. This may indicate that this particular volume of soil near the biovent well has been remediated to a degree.

Since piezometer P-1 is located approximately 10 feet from the bioventing well, it has been demonstrated that the radius of influence during bioventing is at least 10 feet.

In summary, the bioventing results indicate that intrinsic biodegradation is occurring in the petroleum-impacted soil at the site. It also appears that biodegradation through bioventing the vadose zone is a viable method to remediate the vadose zone.

4.6 SUMMARY OF PILOT TEST RESULTS

Based on the pilot studies completed and our knowledge of site conditions the design criteria shown on Table 4.8 were determined.

TABLE 4.8

SUMMARY OF PILOT TEST RESULTS
415 WASHINGTON STREET
ANN ARBOR, MICHIGAN

Type of Test	Radius of Influence (feet)	Hydraulic/Air Conductivity (cm/s)	Operating Conditions
Groundwater Pumping	114 (Saturated Zone)	5.4×10^{-2}	Pumping rate = 18.8 gpm
Soil Vapor Extraction (1)	28 (Vadose Zone)	1.2×10^{-2}	Vacuum = 26 inches of water and air flow rate of 14.7 scfm
Air Sparging (1)	17 (Saturated Zone)	4.8×10^{-3}	Air injection rate = 1.72 scfm
Bioventing	10 (Vadose Zone)	N/A	Injection rate = 1 scfm, biodegradation rate = 0.12 lb/hr

(1) As described in Sections 4.3 and 4.4, groundwater pumping was necessary to successfully implement this test

The results summarized in Table 4.8 will used in the development of a conceptual remediation system and will discussed in Section 5 of this CAP.

5.0 DESIGN OF REMEDIATION SYSTEM

5.1 INTRODUCTION

A feasibility analysis has been completed by NTH to identify the most appropriate remediation method. The feasibility study is presented in Appendix F. Based on the results of the study, the City decided to utilize active remediation methods (Alternative 1 in Appendix F), including pump and treat, soil vapor extraction, and air sparging. The design of this system is presented in this section.

The following design has been developed based on the site investigation data presented in Section 2; the extent of contamination requiring cleanup as determined by comparison with RBCA Tier One values presented in Section 3; and the results of the pilot tests presented in Section 4.

The soil and groundwater zones requiring cleanup are presented in Plates 6 and 7, respectively, and the specific contaminants and their concentration ranges are presented in Section 3. Generally, the contaminants of interest include benzene, toluene, ethyl benzene, the xylene isomers, MTBE and naphthalene.

As indicated in Section 2, a layer of peat traverses the site; the bottom elevation of the peat layer ranges from 790.25 to 792.50 feet. The contour plots of the top and bottom elevations of the peat layer are shown in Plates 3 and 4, respectively. The groundwater elevation during the 1995 NTH additional investigation study ranged from 791.31 to 792.40 feet. Since the bottom elevation of the peat layer and the water-table elevation do not slope in the same direction, the water table is likely to be higher than the base of the peat at some locations, and more so during wet, high recharge episodes.

The relative elevations of the bottom of the peat and the water table are important because they could impact the performance of the technologies evaluated at the site during the pilot test. In fact,

during the pilot test, although the water table was relatively lower than reported by TGI, pumping was necessary to successfully implement the soil vapor extraction and air sparging tests. The pumping is needed to prevent upwelling and to create an-unsaturated zone that will provide a medium for the sparged air to be extracted by the SVE system. Dewatering will also allow remediation of the "smear zone" by SVE, which is a more effective technology than air sparging.

In the following sections we present remediation designs for hydraulic containment of the plume and recovery of free product; remediation of the unsaturated zone above the water table, including above and below the peat layer; remediation of the saturated zone; and the treatment systems. During operations, the performance of the proposed remediation system will be evaluated and adjusted, based on the data collected as part of the monitoring program.

5.2 HYDRAULIC CONTAINMENT AND FREE PRODUCT RECOVERY SYSTEM

The objectives of this system are:

- Hydraulic containment of contaminated groundwater. This will be achieved by creating an adequate hydraulic gradient for the contaminated groundwater to flow to recovery wells to minimize the potential for migration which would increase the extent of the contaminated plume. The number and location of the recovery wells are based on several factors including the radius of influence of each well and the lateral extent of contaminated groundwater. The estimated extent of the contaminated groundwater is shown on Plate 7.

- Dewatering to maintain the water table below the bottom of the peat layer to facilitate the remediation of the soils above the water table by SVE, and to allow for the capturing the sparged air by the SVE system. It is pivotal to lower the water table beneath the peat layer to create an unsaturated sand zone to successfully implement SVE and to capture sparged air.

- Recovery of free-product. Although interim free product recovery has been initiated by NTH in late 1995, it is likely that further collection of residual free product will be required prior to full-scale remediation. This will be achieved by creating an adequate hydraulic gradient for the product to flow to recovery wells from which the product is pumped to the surface. The number and location of the recovery wells are based on several factors including the radius of influence of each well and the lateral extent of product spread.

Our objectives can be achieved by pumping water from up to three wells in a manner sufficient to create a water-table depression. Within the zone of contaminated groundwater, the water depression must have an elevation below the bottom of the peat layer and must create an inward gradient sufficient to maintain a capture zone of influence within the zone of interest.

The results of the pump test indicate that three recovery wells pumped at a rate ranging from 10 to 30 gpm with a total pumping rate ranging from 30 to 50 gpm is expected to create the needed water table depression. As shown on Plate 8, this will be accomplished using existing MW-1 well and two new wells to be installed.

The new dewatering/product recovery (DW/PR) wells will have a 10-ft long, 4-inch ID, PVC screen attached to a 4-inch PVC riser. The wells will be installed to a depth of about 17 feet and will be finished in a 2-ft wide by 2-ft long by 4-ft deep flush mounted manhole (Plate 9). Either a pneumatic pump with a product can or an electric submersible pump and a product scavenger pump will be installed in the well to recover and remove groundwater and product. The wellhead of MW-1 will be retrofitted to meet the specifications of the new well.

5.3 REMEDIATION OF THE UNSATURATED ZONE

Remediation of the unsaturated zone will be addressed by the combination of soil vapor extraction and bioventing methods. Because the peat layer, in effect, divides the unsaturated zone into three layers, we will use two combined SVE/BV wells in each borehole. The shallow SVE/BV well will

be screened about one foot into and one foot above the peat layer, while the deeper SVE/BV well will be screened four feet below the peat layer and about one foot into it from below. These wells will be constructed from 2-inch ID PVC screens and 2-inch ID PVC risers. The wells will finished in 2-ft long by 2-ft wide by 4-ft deep flush mounted manholes (Plate 10).

The results of the SVE pilot study indicates that a vacuum of 0.4 inch of H_2O will develop at a radial distance of 28 feet from an SVE/BV well that is under a vacuum of 26 inches of water and an air-flow rate of 15 scfm per well/trench. Based on these calculations, three SVE/BV well pairs and an SVE trench are proposed (see Plate 8). As shown on Plate 8, the zone of influence for the wells and the trench is expected to span the zone of soil contamination. As shown on Plate 8, the SVE trench will be located along the sides of the Parks and Recreation Building (P&RB). The extraction of air from the trench will minimize the potential for contaminated air to migrate towards the P&RB.

Bioventing will be accomplished by the air (oxygen) being drawn through the contaminated soil zone by the SVE system.

5.4 REMEDIATION OF THE SATURATED ZONE

In addition to the contributions of the DW/PR system to remediation of the groundwater zone, we will implement an air sparging system to accelerate remediation of this zone. Air sparging will contribute to the cleanup in two ways:

(1) Volatizing the BTEX from the groundwater and soil beneath the water table. These volatilized contaminants will be collected by the SVE wells in the unsaturated zone, and

(2) Injecting air within the saturated zone will also provide molecular oxygen to the groundwater and increase the level of dissolved oxygen in the groundwater. This additional

oxygen will become available for in-situ biodegradation of the targeted contaminants, MTBE and naphthalene, and will contribute to the remediation of the saturated zone.

The results of the air sparging pilot test indicate that an air injection rate of 1.72 scfm will create an effective zone of influence of 17 feet. Three AS wells are proposed to assist with the remediation of the impacted saturated zone shown in Plate 5, for a total flow rate of 6 scfm. One of the AS wells (AS-1) is already installed and was used during the pilot study. These AS wells will have overlapping radii of influence and their radius of influence will extend over the zone of highest groundwater contamination. As shown on Plate 8, the area of influence for the air sparging wells occurs within the area of influence for the SVE/BV wells. Therefore, the SVE system is expected to capture contaminated sparged air escaping the groundwater and to minimize the potential for migration of contaminated air to the P&RB.

The new AS wells will have a 2-ft long, 2-inch ID PVC screen connected to a 2-inch ID PVC riser. Both AS wells will be finished in 2-ft wide by 2-ft long by 4-ft deep flush mounted manholes (Plate 11).

5.5 MECHANICAL COMPONENTS

The three DW/PR wells will be connected to (1) a compressor to operate a pneumatic pump for the combined removal of free product and groundwater or (2) to a compressor to operate a product recovery pump per well and to a power supply to operate an electrical submersible pump for groundwater pumping. A water-level sensor will be located in each DW/PR well to maintain the water level at preset levels. Each wellhead will be instrumented with sampling ports for groundwater. The product and groundwater discharge lines will be insulated (with all other lines) in a trench extending below the frost line (3 to 4 feet bgl).

The SVE/BV wells will be connected to a regenerative blower to create the needed vacuum for each well. The AS wells will be connected to an air compressor capable of generating up to 5.0

scfm of air for injection into the saturated zone. Each wellhead will be instrumented with pressure or vacuum gauges, air sampling ports and a valve that will allow for independent control of each well.

All the aboveground instrumentation including compressor, regenerative blower, product/recovery holding tanks and treatment systems will be housed in an on-site treatment shed. The proposed location of this treatment building is shown in Plate 8.

5.6 TREATMENT SYSTEM

Based on an evaluation of the above-ground technologies the following treatment technologies are recommended for this site. Plate 12 illustrates the conceptual layout of the treatment system.

5.6.1 Groundwater Treatment

Groundwater containing dissolved phased gasoline constituents and mixed with free phase gasoline will be pumped from the DW/PR wells. An oil/water separator will be selected to handle a flow rate of up to 50 gpm. Since it is difficult to estimate the rate of free-product recovery, the system will be designed to collect the free product in a 55-gal DOT approved drum. This drum will be instrumented with a level sensor to shut the entire system down in the event that it becomes full. Initial monitoring data of the rate of free-product recovery will be used to optimize the product collection system.

Effluent will be passed through an air stripper prior to carbon treatment. Based on the concentration of BTEX, MTBE and naphthalene in the site's groundwater, the estimated maximum dissolved phase concentration of VOCs in the groundwater is 100 mg/L. As such, the carbon treatment system will be designed to treat groundwater containing a maximum of 100 mg/L dissolved contaminants.

5.6.2 Vapor Treatment

A vapor phase carbon system will be designed to treat the soil gas which will be extracted by the SVE system. The carbon treatment will also treat off-gas from the air stripper component of the groundwater treatment system. The combined air flow from the SVE system and air stripper is estimated to be 300 scfm.

5.6.3 Discharge Permits

We will obtain a permit from MDEQ to discharge the treated air from the catalytic oxider. Discharge alternatives for the treated groundwater include: (1) discharge to surface water, (2) discharge to a public owned treatment works (POTW), and (3) re-injection of treated groundwater. The most feasible and cost-effective alternative appears to be discharge to surface water under an NPDES permit into Allen Creek Drain. It is anticipated that approval for re-injection of groundwater from the MDEQ will be difficult to obtain. Discharge to a POTW is technically feasible, but discussions with POTW personnel indicate that this is not a permanent option. Therefore, we have assumed that the discharge will be to surface water. Due to the nature of the contaminants, we have assumed that an NPDES general permit will be applicable for this site.

Furthermore, we will obtain a building permit for the treatment building and a flood plain, or floodway, development permit for the proposed remediation activities.

5.6.4 Schedule

The schedule for the construction and operation of the remediation system is shown on Plate 13. As shown on Plate 13, the construction of the system is expected to start 6/24/96 and the system operation is expected to start 8/9/96.

NOTES:

[1] Samples collected by NTH Consultants personnel in September 1995 and analyzed by NET Laboratories of Auburn Hills, MI.
[2] µg/L - Micrograms per liter (= parts per billion); mg/L - Milligrams per liter (= parts per million).
[3] ND - Not detected at or above laboratory-reported method detection limit for indicated parameter.
[4] --- - Not tested for indicated parameter.
[5] (A) - Background, as defined in Rule 701(c), may be substituted as the cleanup criteria if higher than the cleanup criterion.
[6] * - Aesthetic-based criteria--Use of the most restricitve criteria is required, therefore health-based criteria is not presented.
[7] Cgw - Concentration in groundwater, if not exceeded, is considered safe for exposure.
[8] GSI - Presented only to establish groundwater criteria which are protective of surface water.

APPENDIX F

Feasibility Analysis

Feasibility Analysis

The PA213 RBCA guidelines indicate that the feasibility of a Tier Two closure must be considered in evaluating remedial alternatives. To satisfy this requirement, NTH evaluated the potential exposure routes to points of compliance located at the property boundary and adjacent to the Parks and Recreation Garage. We then performed a groundwater transport model to estimate potential maximum concentrations of benzene at points of compliance and points of exposure. Benzene was selected because it has the lowest cleanup criteria of the parameters of concern at the site.

Evaluation of Data

Review of various reports, laboratory data, and additional information for this site indicates that the primary concern with the presence of residual petroleum compounds focuses on potential exposure routes involving groundwater, since direct contact with soil is prevented by existing pavement and the depth of contamination. The principal exposure pathways appear limited to inhalation of volatilized VOCs, and to lesser degree, ingestion of contaminated groundwater. Groundwater samples with VOCs (primarily benzene) concentrations exceeding drinking water criteria have been collected from the remediation area. In addition, several groundwater samples have been encountered with contaminant concentrations exceeding groundwater-surface water interface criteria and groundwater volatilization criteria.

Although the City requires buildings to use the municipal water supply, the City does not specifically prohibit installation of groundwater wells for private use. Consequently, private use of impacted groundwater provides a potential human exposure pathway, including oral ingestion, skin contact, and consumption of food products irrigated with impacted groundwater. However, Part 213 allows for control of these routes of exposure through implementation of institutional controls which prohibit use of impacted groundwater.

The petroleum compounds of concern in site groundwater are principally limited to BTEX and naphthalene, with benzene serving as the indicator compound. These compounds, particularly BTEX are volatile, and as such, represent sources of receptor exposure via inhalation of volatilization to outdoor air and vapor intrusion into buildings. The concentrations of VOCs and naphthalene detected in soil at the site do not exceed draft Part 213 Tier I criteria, nor do the concentrations detected exceed ASTM Example Tier I criteria for groundwater volatilization to outdoor air. However, some compounds, particularly benzene, have been detected in one or more groundwater samples with levels exceeding ASTM criteria for groundwater vapor intrusion into buildings.

In summary, the following exposure routes which require further evaluation have been identified for the site:

- Groundwater Contamination: Ingestion
- Groundwater Contamination: Vapor intrusion into buildings If institutional controls are applied to groundwater at the site (an ordinance prohibiting private use of groundwater in the area), then the concern which remains at the site is limited to potential volatilization of benzene into existing buildings, specifically commercial buildings, on and offsite.

Modeling Method and Results

To estimate the concentration of benzene at the potential exposure points, we utilized a three dimensional closed form model developed by Baetsle. For any point defined by 3-dimensional coordinates, the model estimates the concentration of benzene at any specified time. The model input data include the mass of contaminants, dispersion coefficients (the rate at which contaminants are mixed with clean water at the edge of the plume), soil retardation factor (the rate at which the contaminant adheres to soil), contaminants' decay factor (the rate at with biodegradation takes place), groundwater velocity, time, and coordinates of the point of exposures relative to the location of the release.

The results of the analyses show that using reasonable assumptions for decay, retardation, and dispersivity, it can be estimated that off-site locations will not exceed the Tier I criteria in the future. However, a sensitivity analysis showed that the model results are significantly dependent on the selection of input parameters, particularly decay. The potential range for decay values for benzene in the existing literature base is more than one order of magnitude. For this reason, the results of such modeling can be only used as a guide in selecting the most appropriate remedial option.

We recommend the collection of additional groundwater quality data to compare to the 1992/3 and 1995 data base to assist in evaluating the decay rate at the site, relative to the rate of groundwater migration. A description of the recommended data collection plan is presented below.

Remediation Alternatives

As a result of the preliminary Tier II modeling, we have developed several approaches to remediation of the Parks and Recreation Garage site:

Alternative 1 - The first alternative is to proceed with the remediation plan detailed in the Draft Corrective Action Plan presently being reviewed by the City. This alternative will achieve the cleanup criteria in the shortest time (approximately 2-3 years).

Alternative 2 - The second alternative is to rely on the intrinsic bioremediation that appears to be taking place at the site, and to install a system of contaminant containment. This alternative would consist of the following: one groundwater pumping well to prevent the plume from migrating; a soil-vapor extraction trench to extract soil gas vapors under the building and to prevent vapors from migrating under the building in the future; and periodic sampling and analysis to monitor the progress of the intrinsic bioremediation, which uses microorganisms and oxygen already in the soil and groundwater. This alternative has a time frame and cost estimate between alternatives 1 and 3.

Alternative 3 - The third alternative is to take advantage of the intrinsic bioremediation, without containment of contaminants. This alternative is feasible if intrinsic biodegradation is taking place at a rapid pace (faster than plume migration) as identified by the data collection plan outlined below. No construction or operations and maintenance would be required, only periodic sampling and analysis to monitor the cleanup progress. This alternative has the lowest estimated cost and the greatest uncertainty in time of remediation (approximately 5 years).

The comparison of 1992/3 to 1995 data shows that intrinsic biodegradation has taken place, but does not provide enough information to determine the rate. We recommend that additional round of sampling be performed to provide data for 1996 for further evaluation. This sampling round would be required to pursue the second and third alternatives listed above. The estimated cost to implement each alternative is shown in the attached table.

Additional Data Collection Plan

The additional data collection will include the following tasks: 1) Drilling two additional soil borings and installing two additional monitoring wells; 2) Sampling of existing monitoring wells and the new monitoring wells.

Two new soil borings will be drilled, one just south of former boring location AH-2 and one near former boring location AH-4. The soil boring will be drilled using hollow stem auger techniques. Soil samples will be collected on a continuous basis, from two feet below ground surface to the terminus of the boring, using a split-spoon sampler. Soil samples will be screened in the field, for the presence of volatile organic compounds (VOCs), using a portable photoionization detector (PID). If field screening indicates the presence of elevated VOCs, selected soil samples will be submitted to an analytical laboratory for BTEX, MTBE and PNA analyses. If there is no evidence of VOCs, soil samples will not be submitted to the laboratory.

Upon completion of each borehole, a monitoring well will be installed. Each well will be constructed using flush threaded, two inch diameter PVC, .010 slotted screen and two inch diameter PVC, solid riser casing to existing grade. The well screens will be no more than five feet in length and will be installed straddling the water table to allow for seasonal fluctuations and to allow for the entry of possible free floating hydrocarbons. The annular space around each well screen will be packed with a uniform silica sand not more than two feet above the top of the screen and topped with a bentonite seal to prevent surface contamination from entering the well. The top of each well will be cemented inside a flush mount road box, to accommodate vehicular traffic.

The wells will be developed by surging and then bailing to remove fine grained materials from the well screen. Well development enhances the hydraulic connection between the well and the surrounding aquifer, allowing transmission of representative groundwater for monitoring and sampling.

The wells will be located both vertically and horizontally using field survey techniques. The elevation of each well and the top of the water table will be surveyed to within 0.01 foot accuracy, using established site elevation data. An electronic interface probe will be used to determine depths to water in each well and to check for the presence of free floating hydrocarbons.

Water samples will be collected from the two new wells (MW-12; MW-13) as well as from existing wells MW-6, MW-7, MW-8, MW-10, MW-11, PZ-1, PZ-2 and PZ-3 for submittal to an analytical laboratory. The samples will be analyzed for the presence of BTEX, MTBE and PNAs. In addition, one duplicate sample and a trip blank will be submitted to the laboratory for QA/QC control.

The cost for completing this plan is approximately $ 10,000.

At a meeting on March 6, 1996, we reviewed the proposed alternatives and cost estimates with Mr. Homayoon Pirooz and Ms. Sandra Kenzie of the City of Ann Arbor Public Service Department, Engineering Division. As a result, the City decided to implement alternative 1 since it is expected to achieve levels below Tier I in a shorter time than the other alternatives. Alternative 3 was not selected by the City because it would require a deed restriction on the property and may require the City to enforce control on drinking water from the aquifer.

Alternative 2 was not selected by the City because the time needed to achieve levels below Tier I may be longer than estimated. As a result, the cost for this system may increase, to become equal to that of Alternative 1. Furthermore, this alternative may require a deed restriction. As a result, the city decided to implement Alternative 1, since it is expected to achieve levels below Tier I in a relatively short period and does not require deed restrictions or drinking water control.

Help shape the Allen Creek Greenway

Public Workshop 1B
A Closer Look: Site Specific Potentials for the City's Parcels

Saturday, April 29, 2006

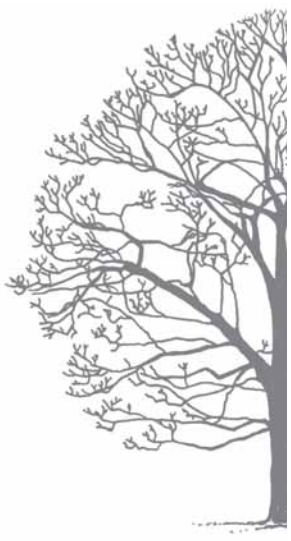
AGENDA

8:30 a.m.	Registration and information displays
9 a.m.	Presentation
10 a.m.	Break
10:15 a.m.	Facilitated brainstorming and discussion of three city-owned sites
11:55 a.m.	Adjournment

OBJECTIVE: To consult the public on the potential of the Greenway and specifically on how to incorporate the city owned properties that are a part of its path.

This workshop was funded by the Ann Arbor Downtown Development Authority in demonstration of its support for alternative transportation and an Allen Creek Greenway

Help shape the Allen Creek Greenway



Presentation and Public Comment

The Greenway to Date ~ City Sites and Connections

6:30 pm
Wednesday
August 2

2nd Floor Ballroom, Courthouse Square
100 S. 4th Ave. at E. Huron

Agenda

6:30 pm	**Registration and information displays**
6:45 pm	**Presentation**
7:45 pm	**Q & A**
8:00 pm	**Public comment**
9:30 pm	**Adjournment**

OBJECTIVE: To hear reactions from the public on the evolution of the Greenway to date. More specifically, to discuss preliminary proposals for the treatment of city-owned properties in the Allen Creek valley and the connections between them.

Section 1: Introduction

This report and its supporting documentation are products of an effort, guided by the Allen Creek Greenway Task Force (ACGTF), to substantiate the potential for an Allen Creek Greenway. The idea of an open space and pathway generally following the Allen Creek storm drain has been discussed for decades. The topic's presence in the City's planning documents can be traced back to the 1981 *Plan for Parks, Recreation and Open Spaces*.

The pattern of community events and City studies over the last few years involving urban development in general, and potential impacts on the downtown in particular, include the Downtown Residential Density Task Force (citizen volunteers, Sept. 2004) and the Recommended Policy Framework for Downtown Ann Arbor (Calthorpe Associates, Dec. 2005). These studies and supportive citizen advocacy helped lead to City Council action establishing this task force to consider the Allen Creek valley as a greenway. Council's enabling Resolution, R-285-6-05, can be found on page 6 of this Introduction.

Work of the Task Force

Since its beginnings in September of 2005, the ACGTF has been gathering data in the attempt to define and frame key factors to consider; evolve options for the three City-owned sites and the connections between them; seek comment from the Ann Arbor community; and pursue consensus within the Task Force so as to present recommendations consistent with Council's enabling resolution. This report summarizes these activities and the process leading to the Task Force's findings.

As a final report to Council and the community, it is intended to accomplish two primary purposes:

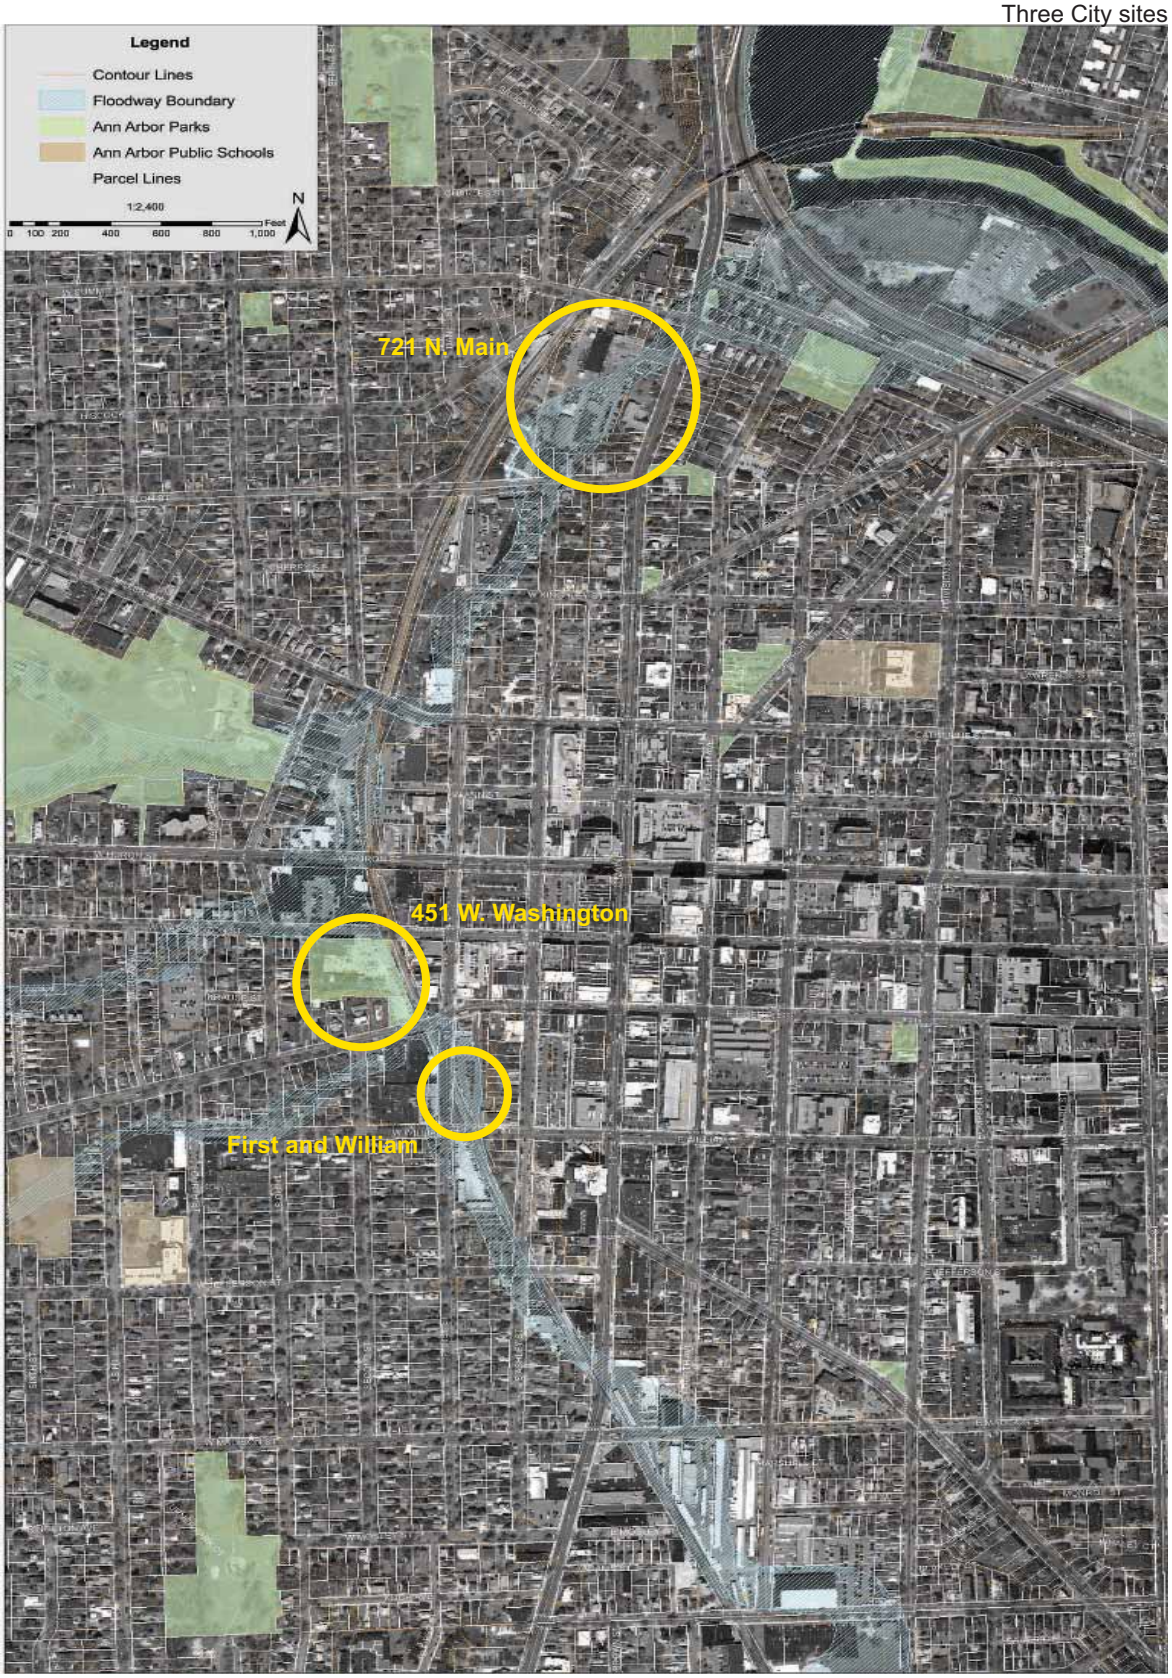
1. **objectively present key considerations, and,**
2. **offer recommendations and options based on clearly defined priorities.**

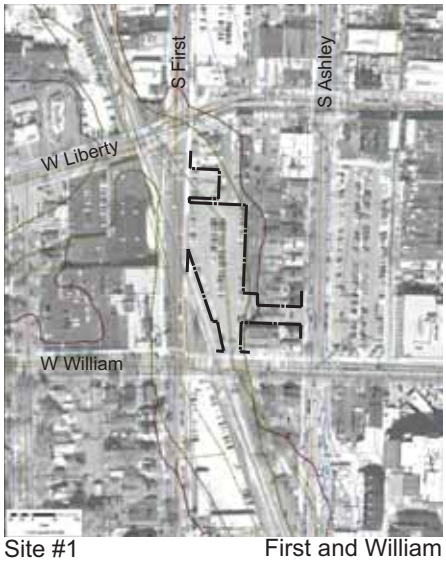
The Task Force reached consensus on several aspects of establishing a greenway in the Allen Creek valley.

First, and most significant, is agreement that there can and should be an Allen Creek Greenway, and that, at a minimum, it should occupy the floodway portion of the City's sites in the Creek's floodplain.

Second, the Task Force authored a Vision, Definition and 12 Planning Principles to help guide community discussion.

Three City sites





Site #1 First and William

Site #2 415 W. Washington

Site #3 721 N. Main

Third, the community should take a long term view toward continuing to refine the vision along with short term actions to begin implementation.

The Task Force also reached consensus about how to treat one of the three sites listed below that the City owns along the route of the Greenway. The three sites are:

- **First and William Streets** parking lot, a Greenway garden recommendation
- **415 West Washington** City maintenance yard, with alternatives A, B & C
- **721 North Main** City maintenance yard, with alternatives A & B

Findings and Recommendations

This report is presented in six sections to facilitate use of its content:

1. **Introduction ~** the background and approach to this study
2. **Context ~** a discussion of both area-wide and site specific considerations
3. **Recommendations ~** a description of possibilities
4. **Implementation ~** next steps and conclusions
5. **Appendix ~** information related to the findings
6. **Supplemental appendix ~** additional background and general information.

As suggested above, the Task Force has attempted to collect, consider and communicate findings in 2 categories: key factors, which tend to be objective by their nature; and, recommendations, which are based on the interpretation of facts and tend toward opinion.

A note of appreciation is offered to City staff who kept ACGTF members informed as our discussions proceeded to evaluate and prioritize data. We wish to thank Council for giving us the opportunity to work together, and to thank the citizenry who attended regular meetings, lectures and the 3 workshops, who sent email, and who care so deeply about this community.

Lastly, as a City Task Force, the focus by necessity has been on existing City or other publicly owned property, including streets, sidewalks and easements. While we are aware of the implications of this study on adjacent privately owned land, that specific discussion must be left for others as part of next steps.

City Council Resolution, 15 August 2005

D-8

R-258-6-05

RESOLUTION CREATING A TASK FORCE TO PLAN A NEW GREENWAY

Whereas, The City of Ann Arbor has expended considerable resources over a period of years in the creation of a beautiful and scenic Greenway along the Huron River that is used yearly by thousands of walkers and cyclists;

Whereas, The Huron River Greenway will extend "border to border" across the City along the river and link up to riverfront parks and other greenways that will stretch out beyond the City limits connecting to still more greenways;

Whereas, This great Huron River Greenway is nearing completion and will require further staff work and investment and must remain a priority even as plans are developed for the new Greenway addition;

Whereas, The opportunity and desire exists to create yet another Greenway along the Ann Arbor Railroad tracks that will connect to and complement the Huron River Greenway and allow still more City residents to enjoy the benefits of walking and cycling on green pathways;

Whereas, This new Greenway could place a pathway along the western edge of Downtown and beyond to the South and to the North to the Huron River Greenway;

Whereas, If this new addition to the Greenway system of Ann Arbor is to become a reality, work needs to begin soon, the Ann Arbor Railroad needs to be further engaged in conversation with the goal of obtaining an easement or easements, and grant funds need to be pursued;

Whereas, The path of this new Greenway could intersect with three City owned parcels: the current City Garages at 415 W. Washington and 721 N. Main, and the City owned surface parking lot at First and William;

Whereas, Any Greenway path shall include the possibility for future rail transit use;

Whereas, The City is building a new maintenance facility and plans to vacate all or some of the City owned land at 415 W. Washington and 721 N. Main when garage operations are moved to the new site;

Whereas, The First and William site will be needed for parking for at least three years as new parking is developed;

Whereas, A task force made up of City residents, residents who serve on City boards, and City Council, will be needed to work with City Staff to develop a recommendation to City Council for the development of the new Greenway that will complement and connect to the existing Huron River Greenway;

D-8

Whereas, A planning effort for the downtown area is underway and the City has engaged Calthorpe Associates to work with residents, City Staff, the Downtown Planning Steering Committee, the Planning Commission, the Downtown Development Association and City Council; and

RESOLVED, The City Administrator shall begin substantive discussions with the Ann Arbor Railway to gain their cooperation in the creation of a Greenway along the Railroad Right of Way;

RESOLVED, That City Council will, no later than September 6, 2005, appoint a nine member task force that will serve until September 30, 2006, to work with City Staff and others involved in the Downtown planning process to develop a recommendation for a new Greenway that will follow roughly along the Ann Arbor Railroad Right of Way to the west of Downtown and connect with the existing Huron River Greenway;

RESOLVED, The New Greenway Task Force will include one member of the Parks Advisory Commission, one member of the Planning Commission, one member of the Downtown Development Association, one member of City Council and other City Residents.

RESOLVED, The New Greenway Task Force will develop a preliminary recommendation to be delivered to the Downtown Planning Steering Committee no later than November 1, 2005, and a final recommendation to be delivered to the Planning Commission, The Parks Advisory Commission and City Council no later than October 1, 2006. To assist the Task Force in making its recommendations, it shall conduct a series of public workshops, and consult with independent design, parks, and watershed professionals, in addition to its work with City Parks and Planning Staff and Commissions;

RESOLVED, That the area of the City properties at 415 W. Washington and 721 N. Main within the floodway will be included in the new Greenway. The remaining portion of these sites will be reserved for mixed use, which could include additional park or Greenway area, space for non profit organizations, art, housing, and/or commercial entities; and

RESOLVED, The New Greenway Task Force will include in its final report a recommendation for the eventual use of the City owned property at First and William that is currently used as a surface parking lot.

Section 2. Context

The process of collecting, understanding, evaluating and using data was key to reaching closure for the Task Force's report. Determining what was available was the initial step; judging its relevance was the next step. Data that was out of date, incomplete or unavailable soon surfaced. Contemplating the role and significance of missing information was an exercise in moving forward with care; resolving how to use mixed levels of data was critical to issuing this report with clarity and transparency.

The time frame given the Task Force to provide recommendations required use of currently available specific data and of the conceptual level implications of data not yet available. Uneven information could not be treated as an inhibitor to decision-making; it was but another factor to evaluate.

Considerations
The information that follows has been gathered into categories to objectively present key factors both individually and as one item might influence the others. Findings are a synopsis of each subject covered. More complete documentation of data can be found in the attached Appendix and Supplemental Appendix.

Categories used to consider and frame recommendations for the Greenway in the Allen Creek valley include:

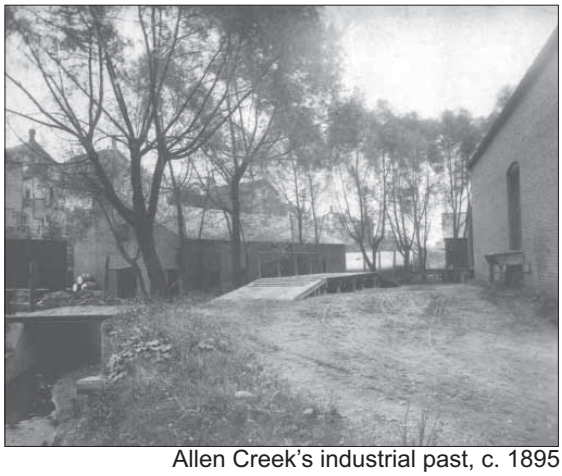
- City setting
- A brief history of Allen Creek
- On-going policy efforts
- The valley as City landscape
- The valley as Greenway
- The floodplain and water management
- Open space and recreation
- Safety
- Economic impacts
- Changes in time

City Setting

The role of a downtown today is different from that of the past. Downtown was the place for a community's economic, social, cultural, educational and recreational activities. Post World War II's automobile use and new development patterns changed the very nature of urban life in the United States by spreading and diversifying the locations where people could live, and where goods and services could be found. Today, use of the "electronic highway" (the internet) is changing social, cultural and economic patterns once again.

Activity along Huron Street, c. 1908

A summer's eve on Main Street, c. 1990



Allen Creek's industrial past, c. 1895

Ann Arbor's center has evolved, too, and remains a place where people work, go to school, play and, to a lesser degree, live and shop. Efforts are underway to increase Central Business District (CBD) activity by changing zoning to encourage a more residential downtown. Adjacent residential neighborhoods, several with historic district designations, also contribute to the numbers of people living within easy walking/biking distance of downtown.

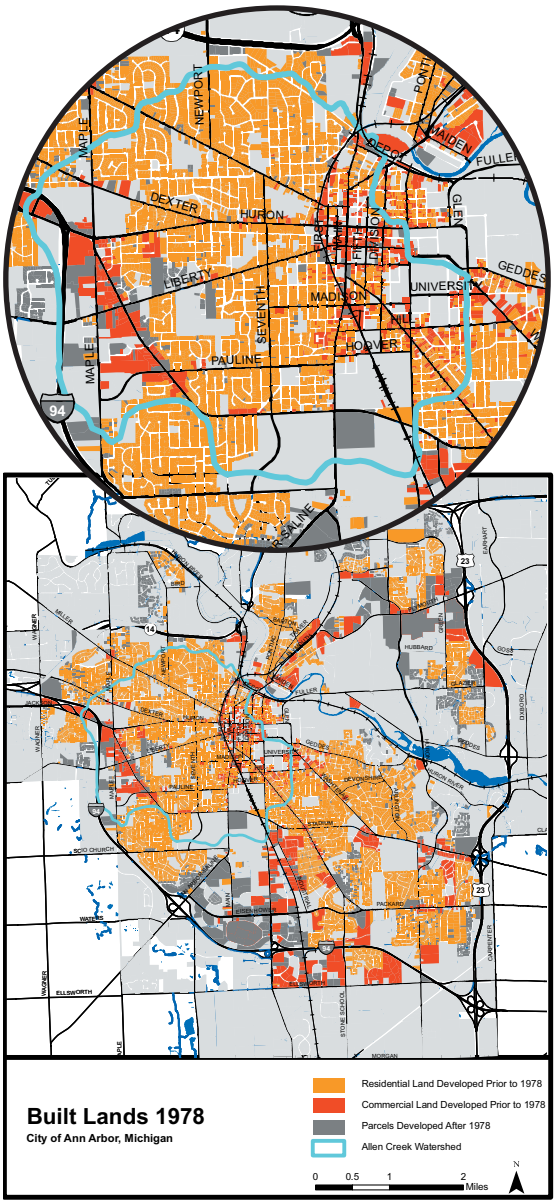
The experiences one has in and adjacent to our downtown are derived from the sum total of its interior and exterior spaces, and its various venues for events and activities. Downtown is also the product of human actions over time. Its character evolves from the combination of daytime and nighttime, weekday and weekend, academic season (grades K-12 and The University's calendar), the natural cycle of spring-summer-fall-winter seasons, and the cultural calendar including University Musical Society, Ann Arbor Symphony, Summer Festival, the Art Fairs, parades, etc. Audiences for this rich and eclectic menu vary as much as the events themselves.

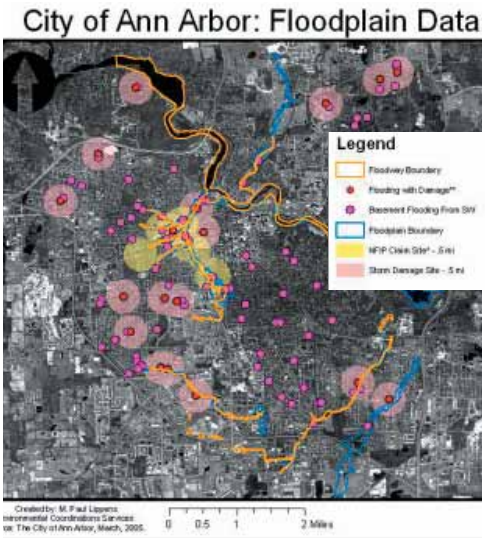
At the same time, urban and built amenities are incomplete without a complementary natural infrastructure that includes, but can go beyond, a typical suburban park. The Huron River, while not distant in miles, is outside the typical perception of Ann Arbor's downtown. The Allen Creek Greenway can help to change that current reality.

A Brief History of Allen Creek

Named in 1824 after one of Ann Arbor's founders, John Allen, Allen Creek helped form the City's identity. Settlements were built along the creek to take advantage of a ready source of water. As the 19th century progressed, industries that required water located there, too: a flour mill, tanneries, a foundry, and breweries, among others. The flat, floodplain topography of the valley, and the industries within it, led the Ann Arbor Railroad in 1878 to lay its tracks parallel to the creek. By century's end, the pastoral nature of the lower Allen Creek valley had changed to an industrial one, and the water quality and ecosystem of the creek diminished.

Residential development in the late 19th century immediately to the west of the main branch resulted in the continuing increase of impervious surface in the creek's catchment area. That area is now the historic neighborhood known as the Old West Side. By the early 1920's, the creek's water quality was such that property owners demanded the City put the creek into a storm sewer.





The main stretch of the creek was piped in 1926, and the lower segments of the main branches shortly thereafter. As development continued, so did the amount and rate of runoff entering the drain and, subsequently, the Huron River. Major flooding events occurred in 1947 and 1968.

The City enacted its first rainwater management ordinance in 1978. Even though the creekshed was largely developed by then, the high rate of runoff from pre-ordinance, undetained areas continued to damage the creek's stream-channels, which occasioned further piping such as the Liberty-Glendale project in 1997. City records indicate that, of the National Flood Insurance Program claims (NFIP) filed City-wide between 1988 and 2001, 100% were in the Allen Creek watershed and within a quarter mile of its floodplain. A total of 18 public claims were processed in those 21 years, with a value/payout of $104,000, or $5,778 per claim. There is not a corresponding public record of private insurance claims or other unreported damages.

While more recent City projects such as Liberty Street and Stadium Boulevard reconstructions have included rainwater management components, much remains to be accomplished.

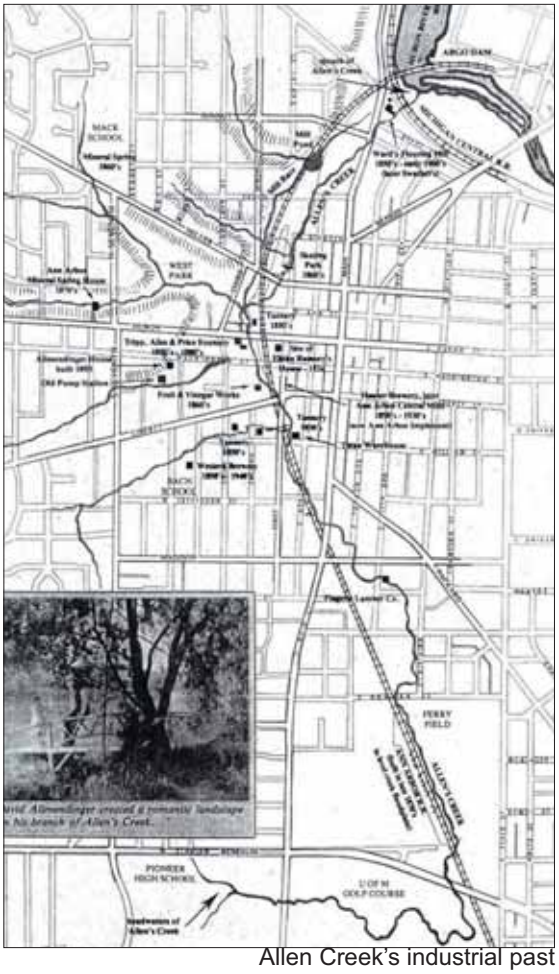
On-Going Policy Efforts

Two policy areas that affect the health and disposition of the Allen Creek watershed are:

1. rainwater, floodplain and hazard mitigation policies, and
2. planning, zoning and development policies.

The City has been grappling with the issue of rainwater and flood hazard management for many years. An annotated history of the past ten years' efforts, some of which are specific to Allen Creek, is included in the Appendix. Recent activity will soon result in the release of new Federal Emergency Management Agency (FEMA) floodplain maps and the drafting of a Flood Hazard Mitigation Plan. A new Request for Services, issued by the Office of the Washtenaw County Drain Commissioner (Allen Creek storm sewer is a County drain), will begin the process of dynamic modeling in the Allen Creek drain. Planning Commission is working on a new comprehensive floodplain policy as the City continues to contemplate increased density in the downtown.

The City has been engaged in conversations about increasing downtown density through development as a way to foster a lively and stimulating city center and increase the tax base.



Allen Creek's industrial past

The balance between increasing development and open space was an issue raised often in the campaign for the greenbelt millage and the Calthorpe study's public workshops.

The opportunity exists for the City and County (the latter with its authority over the storm drain) to consider policy on floodplain and rainwater management, and for the City to address policies guiding development in the downtown and close-in neighborhoods at the same time. Within this context, the Allen Creek Greenway should be viewed as the linchpin between considerations of increased core density and floodplain planning policy.

The Valley as City Landscape

Allen Creek was infrastructure for 19th century Ann Arbor. Even with the creek underground for decades, the valley's significance remains.

The bottom of the valley, at this moment in time, is largely a "keep out" or "pass by" zone. Its personality is witness to the Ann Arbor Railroad's safety and no trespass rules; other adjacent private mixed use property; and limited access at the 415 W. Washington and 721 N. Main municipal yards, Fingerle Lumber storage yards and U-M's property. Some of the area's appearance can be judged unsightly and unfriendly.

The valley also links a variety of distinctive neighborhoods, districts and features. Its south end is rooted in the University's golf course and athletic campus, and running successively North through the Lower Burns Park and Pioneer High/Allmendinger neighborhoods, the Downtown, the Old West Side (OWS), the North Central Property Owners Association (NCPOA), and the Spring-Brooks-Fountain neighborhood where it connects to the City's Huron River Greenway and the County's Border-to-Border Trail. The floodplain runs alongside or near the commercial areas at South State and South Industrial, the Downtown, Kerrytown, and the North and South Main mixed-use corridors.

The Valley as Greenway

Communities across the country are working to develop greenways with multi-use trails serving both recreation and commuter needs. Trails can play a vital role in improving communities offering an innovative means of revitalizing urban areas, reusing degraded lands, and balancing density with

AARR tracks crossing city streets

City-owned parcels in the Allen Creek valley

multi-purpose open space. The concept of greenways evolved as a form of adaptive environmental re-use and is becoming a key component of urban infrastructure. As a growing body of literature demonstrates, urban greenways respond to a number of community values and can fulfill a variety of objectives ranging from rainwater management, improved water quality, aquifer protection, and habitat preservation to non-motorized transportation, open space, and economic development.

In Ann Arbor, the idea of a greenway following Allen Creek goes back to the 1981 Plans for Parks, Recreation and Open Spaces (PROS), and again had a prominent place in the 1988 Downtown Plan. Each successive PROS Plan has included the goal of an Allen Creek Greenway. In March 2005, the Ann Arbor Park Advisory Commission passed a resolution recommending that City Council dedicate the floodway portions of the three publicly owned parcels in the Allen Creek valley as anchor parks in the Greenway. The resolution also called for active public input into determining appropriate community uses for the flood fringe portions of the parcels.

Later in 2005, several hundred citizens participated in three public workshops conducted by Peter Calthorp & Associates to solicit public input in planning the future of downtown. At these workshops, citizens expressed a strong desire for a Greenway along the Allen Creek valley at the western edge of downtown. This, along with continued citizen-initiated efforts, became part of the impetus for Council to establish the Allen Creek Greenway Task Force to study the possibilities for an Allen Creek Greenway.

The Task Force's consensus recommendation is in support of the floodway portion of the floodplain on the three City-owned sites becoming the Greenway. The question remaining for Council and the community to consider is the extent to which the Greenway's open spaces might utilize additional portions of the soon-to-be-vacated City-owned maintenance yards. Discussion of this aspect of the recommended Allen Creek Greenway, and its longer term future, will need to include the emerging presence of the Allen Creek Greenway Conservancy, and the constraints and opportunities of City government.

The Floodplain and Water Management

The combination of rainwater and runoff are what many in the community believe to be a major consideration in determining the form and substance of the Greenway. The topic is also one with uneven levels of existing information.

The Task Force engaged this discussion in two ways:

- a conceptual, big picture approach to the role and use of a floodplain; and,
- a more specific consideration of rules and regulations governing how one is permitted to use a floodplain.

In other words, community acceptance of existing laws enabling an owner to either develop new buildings or to rehab and re-use existing buildings in a floodplain is a different policy from no longer allowing such development to occur. The community needs to engage in this discussion and determine its floodplain policy consistent with core values, both public and private.

Existing laws and requirements governing development within FEMA floodplain boundaries are:

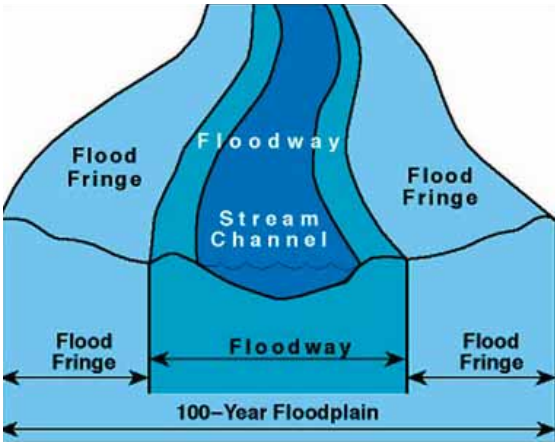
1. **General Criteria**
   - Construction projects within the Allen Creek Drain's 60' wide easement require a permit from the Washtenaw Country Drain Commissioner. Architectural construction within the easement is typically not allowed.
   - Construction projects within the floodplain require a permit from the Michigan Department of Environmental Quality (MDEQ).
   - Federal, State, County and City all require no net loss of flood storage capacity, i.e., no fill without compensatory dredging.
   - Flood flow may not be obstructed in a manner that causes a rise in flood elevations at the property line.

2. **Criteria within a Floodway**
   - State law prohibits new or expanded residential uses within a floodway.
   - The lowest floor of any new non-residential must be one foot above the 100-year flood elevation.

3. **Criteria within a Flood Fringe**
   - The lowest floor of any new residential or non-residential must be one foot above the 100-year flood elevation.

4. **Criteria for Rehabbing Existing Buildings**
   - If renovation of a residential building within a floodplain exceeds 50% of the value of the structure, the first floor of the building must be elevated to one foot above the 100 year elevation.
   - If the building will be non-residential, and renovation exceeds 50% of the value, it can either be elevated to one foot above the 100 year flood elevation or flood proofed.
   - If the building footprint is not going to be increased, and the added value will be less than 50% of the value of the building, no floodplain requirement exists.

5. **Criteria for Historic Properties**
   - Modifications to historic properties that do not increase the building footprint are exempt from floodplain requirements in the state building code.



A floodplain is the horizontal dimension equal to the floodway plus the flood fringe, and the vertical dimension, or topographic elevation, of the 100 year storm event.

The floodway is the land area adjacent to a channel that carries and discharges the base flood flow of a stream or river.

The flood fringe is the dimension between the floodway limit and the 100 year floodplain line. This location, when under consideration by the Task Force, is where alternate, City-owned site-specific recommendations emerge in response to different interpretations and priorities. A discussion beyond the direct role of the Task Force, the status of all 6 creeks' floodplains within the City is a central component of the community's continuing floodplain policy conversations.

The Allen Creek **floodplain maps** are outdated, and new draft maps will soon be available. It's likely that the location of the floodway and 100 year floodplain lines will change. The concept and principles stating that, at a minimum, the Greenway will occupy the floodway portion of the floodplain remains valid regardless of the actual location of that line.

The topic of **rainwater management** and treatment of runoff is directly related to the floodplain. The three City sites are located in the lower third of the Allen Creek watershed. The middle and upper reaches of a watershed are where the most benefit is gained by detaining runoff; lower reach runoff should enter the receiving water body (in this case, the Huron River) sooner

7/23/99 Depot Street

than later thereby spreading the impact of concentrated runoff at lower flow rates and over a longer period of time. In effect, detaining large amounts of runoff on these three City sites as part of a greenway is not recommended for reasons of location in the watershed, and such storage could negatively impact the location of floodplain limit lines and impede the flow of flood water through these sites.

Surface flooding begins along the Allen Creek storm drain at approximately a 1.5 year storm event, which is equal to the "bankfull storm event" as defined by the Office of the Washtenaw County Drain Commissioner, or approximately 2.3 inches of rain in a 24-hour period. Storing volumes of water beyond the bankfull event on the three City sites could interfere with flooding patterns and is not recommended by City staff. Controlling the bankfull storm event for the runoff from each site would provide water quality benefits without significantly exacerbating flooding.

In all instances, and in any location within a watershed, rainwater management goals, in order, are:

1. **reduction in runoff**
2. **water quality best management practices**
3. **detention/retention.**

The three City sites are appropriate locations to implement measures to decrease runoff and improve water quality onsite and, if possible, from the adjacent landscape.

Recreation ~ Public Open Space

Campus at South State & North University

Allen Creek runs along the western edge of the approximately 270 acre Central Business District (CBD). The CBD is roughly contiguous with the Downtown Development Authority (DDA) district. Of the total DDA area, 80 acres are public rights-of-way. The area of the two City-owned parcels in the CBD is 3.5 acres, or about 0.2% of the non-right-of-way land area of the DDA district. The 5.1 acre N. Main site is outside the DDA boundary.

The CBD contains various types of open space. The University of Michigan Central Campus "diag" and its adjoining lawns, courtyards, gardens and plazas is one example. Another is in the heart of the downtown: the Dean Promenade on Main Street, which, with its broad sidewalks, streetscape, and restaurants, provides a delightful urban experience. These dining and socializing sidewalk activities occur in other locations including Liberty, Washington and State, and on private property where building setbacks allow.

- University of Michigan
- Wash County Drain Commission
- Washtenaw County

Park System Properties in and near the CBD

There are four properties within the CBD that are urban City parks. These include Liberty Plaza (0.26 acre), Sculpture Plaza (0.09 acre), the Farmers Market (1.06 acres), and the historic Kempf House (0.13 acre).

Several neighborhood parks lie in areas adjacent to the CBD: North Main Park (0.47 acre), Wheeler Park (1.93 acres) and West Park (22.93 acres), which function as neighborhood parks with play areas.

The Parks Advisory Commission and staff, in planning parks, recreational amenities, and open spaces to be incorporated in the City's public park system, considers the CBD and the central neighborhoods surrounding it as the Central Planning Area. Its boundaries are Stadium Boulevard, Seventh Street and Summit Street and the Huron River. According to the 2006 PROS Plan, this 1552 acre area contains the highest density and lowest per capita amount of public park and open space in the City.

Planning Area	% Park Acres	Park Acreage/ 1000 persons	% Neighborhood Park Acres	Neighborhood Parkland/ 1000 persons
Central	7.90	4.62	18.75	1.66
Northeast	43.00	26.16	27.08	2.60
South	17.00	11.91	32.64	2.60
West	32.10	21.78	21.53	2.89
CBD	1.54	0.57		

Within the 270 acre CBD, the ratio of park and open space to people is lowest at 0.57. The addition of new residential units within the CBD will decrease this ratio further. Whether or not one adopts the view that standards for the amount of park and open space in the CBD should differ from those for residential neighborhoods, the data is part of the information to consider as possibly influencing the Greenway's final form.

Other recreational opportunities

The Center for Disease Control and Prevention reports that 60% of our population is not getting enough physical activity. The City of Ann Arbor Non-Motorized Transportation Plan recommends bike routes in the downtown and throughout the City, which would provide good access to the Allen Creek Greenway from different parts of the City. There is great interest in increasing walking and biking opportunities; the Greenway would provide both a destination and a path for those activities.

Safety

In the public space of urban parks and greenways, personal security, both actual and perceived, is critical to users. Women, the elderly, children, and people with disabilities often feel particularly vulnerable in public spaces that evince any degree of risk or perceived risk.

While tension can exist between public use and what is best for environment, the two goals – environmental integrity and public use – can coexist. The relevant literature indicates that the spatial design of parks, levels of use, programming, lighting, maintenance, and enforcement contribute to the safety of urban parks. There is a growing body of environment-behavior research that provides useful principles for planning and designing greenways that are both "green" and safe. These principles include: visibility of others, visibility by others, choice and control, solitude without isolation, and environmental awareness and legibility. Design and management considerations include lighting, signs and maps, vegetation management strategies to allow clear sightlines along trails and into adjacent destinations, pathway options and a variety of entrances and exits, policing by City and neighborhood groups, and the location of activity generators.

The mixing of track, street and sidewalk

It is well documented that use of public space tends to lead to more use. A recurring theme in the literature on safety is that increased levels of use contribute to enhanced perceptions of safety in parks. Opportunities to encourage use should be fostered, since activities that draw people are perhaps more important than physical design in enhancing real and perceived safety. The perception of risk must be avoided, since a perceived lack of safety results in decreased use, which in turn can lead to actual risk.

Economic Impacts ~ Pressures on General Fund

Ann Arbor, like most Michigan cities, is experiencing financial pressures. The State of Michigan has reduced revenue sharing to all Michigan cities and the impact of Proposal A and the Headlee amendment results in decreasing property tax revenues. At the same time, healthcare costs for city employees and retirees are rising and the cost of meeting the city's pension obligations is substantial.

In addition to these pressures on the General Fund, the City is facing several unique challenges. The City is required by state law to provide a home for the 15th District Court when it loses

its current lease at the end of 2009, the police are operating out of a substandard facility, and the current City hall is in a deteriorating condition and not ADA compliant. The need for affordable housing continues to grow and its provision remains a community priority.

721 N. Main Street from the air

The City's land has value; property in or adjacent to the downtown is typically of higher dollar value. Sale of these City sites for cash or as part of a public-private venture is a potential source of funds to partially meet the just mentioned financial challenges, including implementing a Greenway's initial improvements.

The combination of rising costs for standard expenditures and the imminent convergence of several critical needs will make the City's General Fund dollars an unlikely source for developing the Greenway. There are, however, potential resources on which the City can draw to fund development of the Greenway. These are outlined in Section 4 and the Appendix.

Financial Benefits of the Greenway

Edge properties to the Allen Creek Greenway could experience a rise in value if the Greenway is viewed as an amenity. Greater density on these fringe properties could result in higher property values, and TIF and property tax revenues.

415 W. Washington and First and William sites

In April 2005, students at the Stephen M. Ross School of Business at the University of Michigan completed a preliminary feasibility study of the Allen Creek Greenway that included a comprehensive financial model (see Supplemental Appendix). They concluded:

> "Our preliminary analysis and financial model suggests that the potential upside of the Greenway exceeds its development cost…. Much of the economic benefit of the Greenway comes from the edge development that occurs over the 30-year period, which results in significant property tax gains for the city."

They also suggested that "if the Greenway [with development of its fringe properties] is not undertaken in a comprehensive fashion, then the realized cash flows may differ greatly from those that are modeled."

Both the National Park Service and the National Recreation and Park Association provide extensive documentation on the economic benefits that parks and open space bring to communities through their impact on residential property values and the property tax base and in their role in attracting new

AARR ROW and Fingerle Lumber yard

residents and businesses, as well as new tourist dollars. A recent New York Times article cited a study by the national Association of Home Builders that found that “Trails are the No. 1 amenity potential homeowners cite when asked what they would like to see in a new community.”

Rising property values and the stimulus to business are not the only potential financial impacts of the Greenway. If changes are designed appropriately to reduce runoff, the community as a whole could benefit by the lower environmental and financial risk of flooding. A study of flood, hurricane, tornado and earthquake natural hazard mitigation activities over the period 1993-2003, undertaken by the independent Multihazard Mitigation Council, found savings of $4 per each dollar invested in mitigation activities, although the study did not isolate either flood mitigation or a watershed equivalent to Allen Creek.

Depending on the recreational opportunities and programming along the length of the Allen Creek Greenway, its use may also generate revenue directly through concessions, and program or event fees. There may even be an opportunity with the sale of branded products.

A key consideration in the decision-making process will be weighing short term versus long term costs and benefits.

Impacts of Growth and Development on the Community

The 2000 U.S. Census listed approximately 2,800 people living within the boundaries of the DDA district in 1,599 housing units. Residential growth is beginning to occur in the CBD; since 2000, 608 new housing units have been constructed, with others recently approved or in the approval process. It is estimated that current development could require about four years to be absorbed.

New and rehabbed buildings

Development fronting onto the Greenway is possible if and when owners of those parcels determine the economic feasibility of improving their sites and move forward with new or enhanced buildings that provide more retail, office and/or residential spaces. There are potential development sites along much of the Greenway. They exist throughout the downtown and along N. Main to the Huron River. There are also pockets of small commercial and light industrial uses along the edge of the railroad. In other areas adjacent to the Greenway lie older established residential neighborhoods, some with historic designations and some with homes located in the floodplain. Any redevelopment of these various sites’ potentials should consider their location in relation to existing neighborhoods.

Changes in Time

The role Allen Creek played in the growth of the City is similar to the roles of most urban streams and rivers. These waters were a source of needed natural resources; a location for transportation; infrastructure for waste disposal; and today, a rainwater utility with problems. As a result of human activity, the creek is a transformed shadow of its former natural self. Subjugation of the creek began over a century and a half ago. Today's discussion about this Greenway is a step in reversing Allen Creek's past, as is occurring for two others in the City, Mallets and Millers Creeks.

721 N. Main, looking in . . .

A community commitment to changing the face and purpose of the Allen Creek valley could be accomplished without eliminating all signs and symbols of its past. Documenting and interpreting the process and direction of change over time presents an opportunity to amend past actions, point to a different direction and, through deliberate steps, implement environmental improvements.

The Greenway can provide both water quality and open space benefits to in-town neighborhoods and a more dense, residentially enriched downtown. The opportunity exists to transform what is currently a place largely without people between the downtown and its adjacent residential neighborhoods into an open space asset. Implementation of the Allen Creek Greenway can help alter the look and feel of Ann Arbor's urban core.

Any development of the Greenway, with the flood fringe as either open space, existing buildings remaining or new buildings constructed, should use and exhibit "green" technology. Criteria for change should also include the charge to communicate, by design, what it means to be a new physical feature in the Allen Creek valley. The design expression of all future improvements should reflect their unique location in this part of our City. The Greenway's program of uses and activities, along with its design form, can combine to help shape the experiences people will enjoy by being there.

Section 3. Recommendations

Allen Creek Greenway ~ Initial and Preliminary Findings
for inclusion in
A2 Downtown Development Strategy
Page 2

Preliminary Principles

1. **Physical elements within the Greenway**
   The Greenway will…
   a. emphasize and follow the Allen Creek floodplain
   b. provide a continuous and barrier-free pathway that integrates with adjacent City sidewalk, street and transportation patterns and public spaces
   c. incorporate the floodway portions of the City owned parcels at First and William, 415 W. Washington and 721 N. Main as destination public spaces within the Greenway
   d. consider the best uses of the floodplain portions of 415 W. Washington and 721 N. Main in the context of complementing and enhancing the Greenway
   e. express the presence of water by incorporating progressive practices to manage rainwater as an asset
   f. incorporate innovative and environmentally friendly runoff water management, and improve water quality and public safety while recognizing its location within the larger Allen Creek watershed
   g. contain year round uses and amenities that will actively populate the Greenway during day and evening hours

2. **Relationship of surrounding neighborhoods and community to the Greenway:**
   The Greenway will…
   a. be a distinct place with a sense of coherence that unites its entirety and provides a fluid sequence of experiences, each considerate of the changing edge conditions
   b. promote partnerships to use public and private land to establish and develop the Greenway and its edges
   c. spur appropriate adjacent economic development including residential, retail, institutional and community-use opportunities that are mutually beneficial to each other and the Greenway
   d. create a safe environment through diverse edge development which fronts onto and places “eyes” on the Greenway
   e. provide connections to other public spaces and community facilities, and to destinations such as downtown, the Huron River Greenway, and the County’s Border to Border Trail

The **Allen Creek Greenway** will take its place alongside the best and most progressive urban spaces.

27 October 2005, authored by the **Allen Creek Greenway Task Force**: Linda Berauer, Jean Carlberg, James D’Amour, Larissa Larsen, Barbara Murphy, Peter Osler, Peter Pollack, Sandi Smith, Margaret Wong

Allen Creek's industrial past

Section 3. Recommendations

The basis for a recommendation is its use of information. To frame a proposal, objective facts can be interpreted and prioritized to evolve, and then validate, a specific outcome. In this instance, a Task Force recommendation becomes an opinion with the potential to physically change our surroundings.

The Task Force reached consensus early in the process by working to recommend a preliminary Vision, Definition and Principles for the Greenway. Excerpts from the Vision statement speak to and about Ann Arbor.

- "Its one-of-a-kind name conjures an image of a delicate intervention within an Arcadian landscape. Eons ago, the glaciers receded and left behind a topography that determined the flow of our rivers and streams. In turn, this physical context influenced its patterns of settlement—the location of its commerce, industry, institutions, neighborhoods, and open spaces.
- As downtown Ann Arbor approaches a denser and taller future, we must strengthen the presence of the natural resources that have played such a critical role in Ann Arbor's history.
- The physical divide that is currently the Allen Creek valley will become a place of destination, circulation, civic gathering, physical activity and repose."

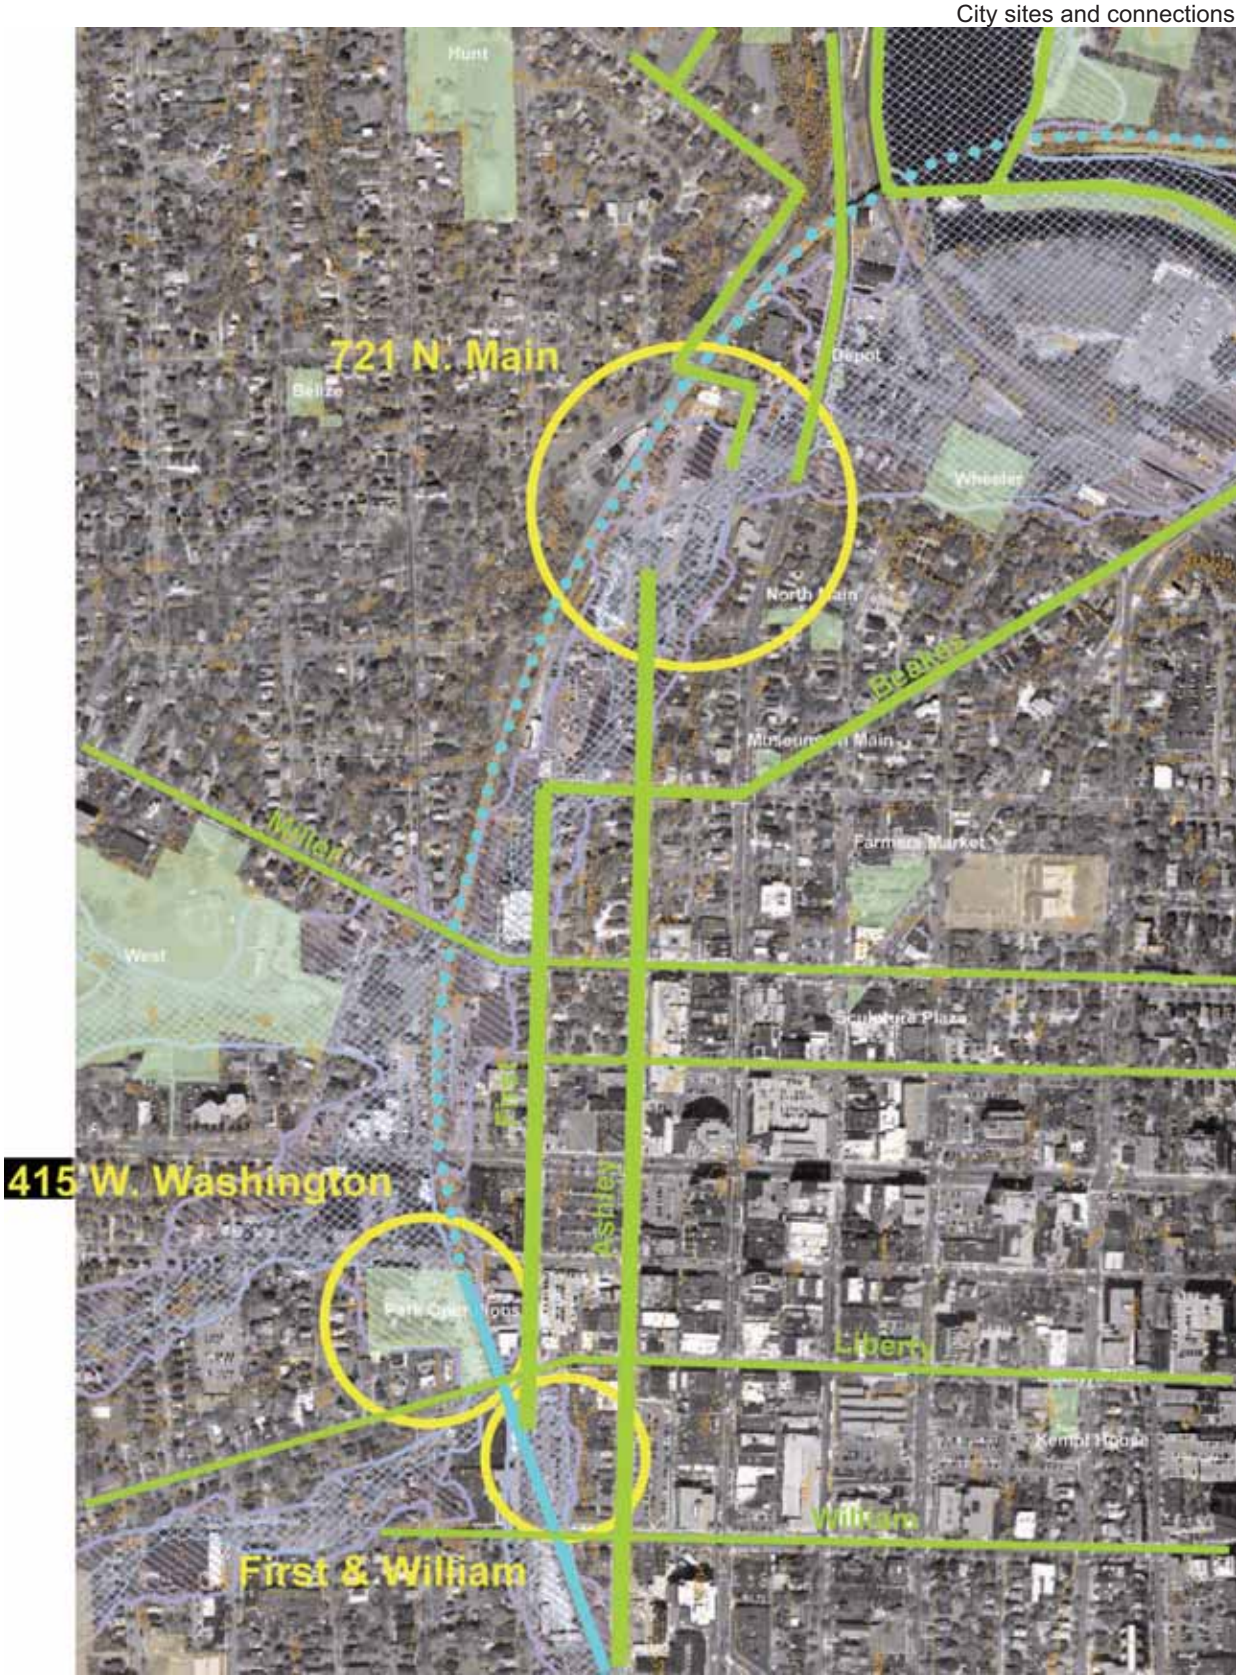
The Task Force's Definition of a future Greenway is

- "a community-wide asset consisting of a sequence of environmentally sensitive open spaces in a City setting; and,
- largely following and relating to the Allen Creek floodplain and its watershed."

Lastly, Planning Principles address the three City-owned parcels included in this study as well as the "relationship of surrounding neighborhoods and community to the Greenway". Both general and site-specific principles are included to guide discussion and decision-making.

The central recommendation of the Task Force builds on City Council's Resolution, and is expressed in the Greenway's Planning Principles. The Task Force recommends that, at a minimum, the Greenway incorporate the floodway portions of the three City-owned parcels at First and William,

City sites and connections



415 W. Washington and 721 N. Main as destination spaces within the Greenway. This primary recommendation leads to a discussion about connectivity, of the linkages between and beyond these three properties.

Connectivity

Incorporating the floodway portion of the three City-owned sites as components of the Allen Creek Greenway is the first step in creating a non-motorized path along the edge of the downtown. The path will connect to the Huron River Greenway and to the Washtenaw County Parks and Recreation Commission's Border-to-Border Trail. Several segments of the Huron River Greenway trail system have been completed; only a few gaps remain within the city. Additional segments between Ann Arbor and Ypsilanti are under construction. Other segments of the Border-to-Border Trail being planned are west of the City along the Huron River. Neighboring municipalities, such as Ypsilanti Township and Pittsfield Township, are developing bike and pedestrian paths connecting with their parks, and linkages from the City to those destinations can be established. The larger network is in the process of becoming a county-wide trail system.

The Border-to-Border Trail

The vision for the Allen Creek Greenway is a path in a continuous, green open space following the floor of the Allen Creek valley along its length and joining the Huron River Greenway. There, pedestrians and bike riders can enjoy a natural setting and cultural amenities and have comfortable travel with the use of the path. In this beginning phase of the development of the Allen Creek Greenway, the floodway of the three City sites could be a destination for nearby neighborhood and downtown residents, workers and visitors.

A well-designed method of identifying the existing sidewalk and street connections between these sites will advertise the evolving Greenway, drawing people to these initial locations. Wayfinding banners and signage, permanently displayed maps at frequent intervals, pavement imprinting and/or coloring, street furniture and unique plantings which all represent the Greenway path will enable pedestrians and bike riders to move easily from one of the three sites to another. A Greenway logo should be a prominent part of wayfinding banners and maps. The maps will identify the Greenway route and nearby park and cultural locations including West Park and other important downtown destinations.

The Bigger Picture

From Non-Motorized Plan

City Streets and Sidewalks

In this beginning phase, the core of the connecting routes for the Allen Creek Greenway is along Ashley and First Sts., with a clearly marked path leading to N. Main St. and, although a bit circuitous, to the Huron River Greenway. At this point in time, a single authorized but unimproved railroad crossing exists at Lake Shore Dr., connecting N. Main St. to the Huron River. The adequacy and number of links across the tracks and connecting to the Huron River Greenway remain problems in search of a solution.

East-west streets which intersect the Allen Creek Greenway, such as Felch, Miller, Washington, Liberty and William, would also have maps indicating routes and locations of both Greenways. These sidewalk routes and on-street bike lanes will need to follow existing traffic signal controlled intersections in high traffic areas.

The City of Ann Arbor Non-Motorized Transportation Plan recommends bike routes in the downtown and throughout the City, which would provide good access to the Allen Creek Greenway from different parts of the city. There is great interest in increasing walking and biking opportunities, and this Greenway would provide both a destination and a path for these activities. Should sites be added to the Greenway, through purchase, donation or easement, connecting routes will possibly change to include new amenities and increase the “way” of the Greenway.

Looking South from William Street

Rails-with-Trails

The long term vision of the Greenway includes a path along the railroad going south from William St. using the Rails-with-Trails concept that has been successfully implemented in Bandemer and Gallup Parks. This could provide a long path from Madison St. to beyond Stadium Boulevard, with few streets to cross. In the first phase of development, no use of the railroad right-of-way as a part of the Greenway’s connectivity could be proposed as talks with the AARR are at a beginning stage. An actual path along the tracks will need to respect the AARR’s concern for safety of pedestrians and bicyclists in proximity to trains. As discussions with the AARR and the U-M continue to seek possible Greenway routes south of downtown, there will be opportunities to increase the number of connecting links.

The AARR north of Liberty is primarily on a berm with trestle bridges crossing above City streets. By law, pedestrians can not access Railroad property. Safety and security concerns will have to be addressed in the design of all Greenway

AARR track at the edge of downtown

improvements and in the choice of additional properties for the Greenway. There should also be continuing conversations with the Railroad around the concept of Rails-with-Trails for this portion of the Allen Creek Greenway, and with Norfolk Southern Railroad to link Allen Creek Greenway and other City parks with the Huron River Greenway and the County's Border-to-Border Trail.

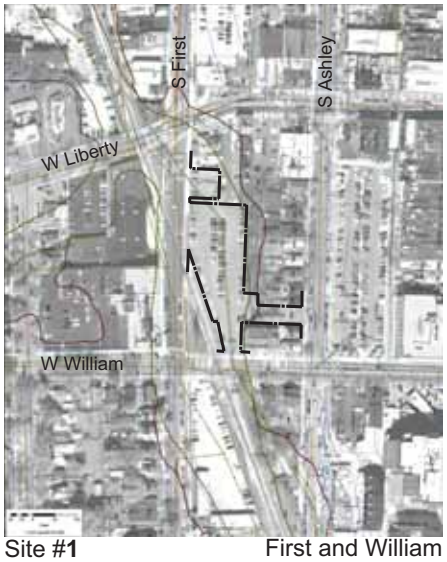
Transportation ~ Commuter Railroad Service

There is great community interest in the possibility of using the north-south AARR rail line for commuters who live outside the City and work here, and to bring visitors into the downtown from other areas. Possible passenger rail stations are suggested for the N. Main and/or the William and First St. City sites in response to this interest.

The north-south rail line is owned by the Ann Arbor Railroad. It is presently used only for shipping freight and does not stop inside City limits. Freight is transferred to Great Lakes Central Railroad which has operating rights for this rail. MDOT owns the track north of Barton Dr. The AARR has not yet expressed interest in allowing passenger service through or into downtown Ann Arbor.

The east-west rail line is owned by Norfolk Southern Railroad, and both freight and Amtrak intercity passenger rail use this line. The Ann Arbor-Detroit Rail Study, with SEMCOG as the planning agency, is examining alternatives for the use of this rail corridor. If a passenger commuter rail option is chosen for this corridor, local transit connections between these two rail lines and employment centers in the City would be needed.

AARR tressle bridge



Site #**1** First and William

Site #**2** 415 W. Washington

Site #**3** 721 N. Main

The Three City-Owned Sites and the Allen Creek Greenway

Greenway use of the three City-owned sites is in addition to initial use of streets and sidewalks in the public rights-of-way for connectivity. The minimum recommendation from the Task Force is that the floodway portion of the three sites be included in the Greenway. The land beyond the floodway, when considered by the Task Force, is where alternative recommendations emerge. As expressions of various priorities for how this location might be treated, the language used to describe the attributes of each alternative should be read as advocating for its particular point of view.

1. **First & William**, Parking Lot
   The Task Force consensus recommendation for First and William is its conversion from parking lot to “urban garden”, with the possibility of including a passenger rail stop, if north-south passenger service is implemented.

2. **415 W. Washington**, City Maintenance Garage
   There are three options for the area beyond the floodway at the City maintenance garage at 415 W. Washington:
   - all open space,
   - re-use of the existing primary building, and
   - new residential buildings and additional open space;

3. **721 N. Main**, City Maintenance Garage
   There are two options for the area beyond the floodway at the City maintenance garage at 721 N. Main:
   - all open space, and
   - new mixed use buildings and additional open space.

Recommendations and alternatives for the City-owned sites will be presented individually and in the order listed above. Discussion of existing conditions will be followed by descriptions and illustrations of the various alternatives.

Existing Conditions

Location: NE corner of First and William Sts., in the DDA/CBD and bordering the OWS historic district. This site is east of the AARR track.

Current Use: A 96 space permit parking lot serving primarily downtown users. After hours (past 6 PM and all day Sunday), the parking lot is available to the general public.

Floodplain and Upland:

The land is divided into:	Acreage	% of total
Floodway	0.85 Ac	85%
Flood Fringe	0.04 Ac	4%
Upland	0.11 Ac	11%
	1.00 Ac	100%

This site is largely in the floodway conveyance zone of the Allen Creek valley's floodplain. Due to the potential risk and liability associated with new or existing buildings in a floodplain, development is controlled by State and Federal laws and required to meet specific regulations.

Allen Creek Drain: The County drain is a large 7'x9' box culvert between 1' and 5' below grade and sitting within a 60' easement controlled by the Drain Commissioner. City staff suggests that the small size of the site could result in the opportunity to employ water quality Best Management Practices (BMP) within catch basins and in rain gardens, and to accommodate first flush on-site rainwater runoff estimated at 635 cubic feet, which translates to an area of 21'x21'x1.5' deep.

Topography: This site has the lowest elevation in vicinity; flat from north to south, and drops 3 feet to a catch basin in the center; approximately 25-foot high hillside on east edge to top of slope of the properties fronting on Ashley. The AARR track is level with First St. and this site.

Vegetation: Adjacent off-site hillside vegetation is largely pioneer and invasive species.

Soils: The site is urban fill, as is the steep slope to the east.

Environmental status: Soil contaminated by arsenic; benzene found in groundwater samples. If asphalt is removed, soil will need remediation.

Adjacent property: North: private offices on Liberty St., and paved alley from Liberty St.; West: 68-unit Liberty Lofts condominiums (Eaton Building) across First St.; East: a rubble fill slope and older residential architecture with mixed commercial and residential uses, and a narrow parcel providing access to/from from Ashley St.; Southeast: town homes on William St.; South: Fingerle Lumber yard, now leased parking across William St. The AARR right-of-way and First St. form the western edge of the site. Additional new residential and mixed-use development planned south, north and east of the site includes Ashley Mews (56 units), Ashley Terrace (93 units), and former City parking structure site at First & Washington Sts.

Notable features: These include the site's openness on its south and west sides where it faces the OWS Historic District, and its single lot connection to Ashley St. on the east. The AARR track and First Street rights-of-way form the property's western edge. The visibility of this property from adjacent public streets will contribute to its presence as a component of the future Greenway. As stated earlier, the Task Force recommendation is use of this 1.0 acre parcel as public open space with a variety of "urban garden" features and activities. Recognition of railroad maintenance activities within its right-of-way will be required.

Parking lot looking South

Floodway

Flood fringe

Upland

Recommendation ~ An Open Space & Greenway Garden

Key Considerations

1. The site is on the edge of the CBD, between the core of downtown and the OWS, and adjacent to the downtown gateway intersection of First and Liberty. Public open space here will serve as an attractive transition and linkage between them.
2. The location of the site is near the liveliest section of the Main St. business district; it is surrounded by a mix of uses (residential, retail, entertainment, office and others) and will provide a diverse set of potential users.
3. The visibility of this property from adjacent public streets will contribute to its presence in the Greenway.
4. The 170 foot length of the AARR track between crossings at William and First will determine the number of passenger cars if this location is to be a commuter rail station.
5. Estimated cost of complete soil remediation to a depth of 20 feet is $3.5 million. Remediation might be phased to accommodate re-use of this site.

Design Intent and Rationale

The location of this site in the floodway, in a transition zone between downtown and the OWS historic neighborhood, and on the edge of the CBD's increasing residential density, led to the Task Force's recommendation. To accomplish multiple objectives and provide community-wide environmental and social benefits, transforming the site into an open space design will

1. manage rainwater and mitigate flood hazard by allowing flow through the conveyance zone to the Huron River;
2. improve water quality by replacing impervious parking lot surface with rain gardens, bioswales or other appropriate methods to filter and cleanse rain water;
3. transform an unsightly transitional zone into an attractive and potentially lively space that links the adjacent residential neighborhood to downtown and functions as a gateway in both directions;
4. provide needed open and civic space in an area of increasing density in the western downtown that can foster increased civic interaction and enhance downtown living;
5. prevent damage to buildings and their occupants by keeping the floodway free of obstructions; and,
6. stimulate edge development and complementary uses

Pros

- Maximizes floodplain flow benefits
- Provides urban garden/open space amenity
- Accommodates rail transit

Cons

- Maximum soil mitigation costs

along Ashley and First Sts. that could result in financial and other benefits to the City.

Parking entry from First Street

The site's potential users include downtown residents, workers, shoppers, and visitors; west side residents; pedestrian and bicycle commuters headed to or from downtown. It should be designed to invite a broad range of activities—planned and spontaneous, active and passive, for individuals and groups.

Active programming, facilitated by good design, is critical to promoting use of the site. Walking groups, morning meet-ups, a tai chi class, sessions of an outdoor chess club, a favored outdoor spot for downtown workers, casual interactions among west side residents and pedestrians, and bicyclists on their way downtown will fulfill the site's potential as a component of the Allen Creek Greenway. The City in addition to neighborhood and community groups can cooperate in this programming.

Program and Design Form

The Open Space design is comprised of four basic elements.

Short Term Parking Lot Reconfiguration ~ **A**

1. **A public open space in the floodway portion of the site.** The primary Greenway path will be incorporated into the overall design, along with lighting, seating, pervious ornamental paving, small and large gathering spaces, temporary and permanent public art installations, signage, and interpretive displays. Ornamental safety fencing will be installed along the railroad right-of-way.

   The contaminated soils on this site will impact planning and require the phased removal of impervious paving for the transformation to landscaped open space. Until the degree and nature of soil and ground water contamination is fully understood, remediation options are yet to be determined. The goal will be eventual full remediation.

   In the short term, the transition from parking lot to Greenway can begin by reconfiguring the layout of the parking spaces and adding ornamental pavement painting or embossing treatments. The small sub-parcel to the north of the main site could be designed as a miniature "woodlot" and rain garden. Over time, additional areas of paving will be removed to create landscaped areas incorporating attractive rainwater quality improvement measures. To maximize the site's ability to capture and clean rainwater runoff, catch basins or catch basin filter systems may be required.

2. **A scenic overlook on Ashley St.** This will provide a view of the floodway immediately below as well as to the

floodway and floodplain at the 415 W. Washington site.

It will contrast strongly with access from the First St. side and will offer an integrated relationship with potential development on the west side of Ashley St. and at the "Kline's" lot. In the very near term, the Ashley St. lot can be developed as a pocket park with educational and informational displays about Allen Creek and the evolving Greenway.

Future development on Ashley St. should be required to provide a friendly face to the Greenway. When development does occur on Ashley St., the pocket park overlook with access to the Greenway below should be retained, either at the present location or at a new location within that block. New development should also accommodate the potential for a rail passenger station at this site by linking the platform with Ashley St.

3. **A pedestrian connection from the overlook on Ashley St. to the Greenway.** Initially this connection could be a simple stairway, to be replaced by a more substantial ornamental stairway and/or elevator as use patterns develop.

4. **Incorporation of the adjacent triangle of land southwest of the railroad track.** This will require an agreement with the AARR to enhance the appearance of this vacant plot to visually tie it to the Greenway open space east of the track. Accommodation of both railroad maintenance activities within its right-of-way and the safe public use of the adjacent Greenway will be required. The City should also complete the sidewalk along First St.

AARR track crossing First Street

If a commuter train service is established along the AARR track, a covered open platform could be located along the track at the southwest corner of the site.

Ownership of the other triangular parcel on the west side of First St. near Liberty St. and adjacent to the new Liberty Lofts retail spaces should be determined. There is potential for this parcel to be visually tied to the Greenway both at First and William and at 415 W. Washington, and this possibility should be pursued.

Implementation Time Line

Phase 1 (immediate and concurrent with parking lot use)

- The site is public property; there is no acquisition cost. Dedicate site to the City park system with a joint operating agreement between Parks and DDA with parking retained

Short Term Parking Lot Reconfiguration ~ **B**

for seven years or until no longer required, whichever comes first.

- Park Advisory Commission, Recreation Advisory Commission, City staff, neighborhood associations and community groups develop programs to establish the site as a locus of activity (initially on Sundays when permit parking is not enforced).
- Develop Ashley St. pocket park and "scenic overlook."
- Develop and install interpretive signage and educational displays to raise awareness of the site's history and its place in the Allen Creek Greenway and broader non-motorized trail network.
- Determine type and degree of soil contamination and develop appropriate remediation plan.
- Develop and implement first step landscaping, parking reconfiguration and soil remediation plan.
- Implement ornamental pavement (painting or embossing) to indicate Allen Creek and the Greenway.
- Continue discussions with AARR including enhanced treatment of railroad right-of-way.

Phase 2 (when site is no longer used as a parking lot)

- Install initial greenway path.
- Continue remediation.
- Implement landscape elements (appropriate to level of remediation) such as rain gardens and other features.
- Continue programming efforts to develop Greenway uses.

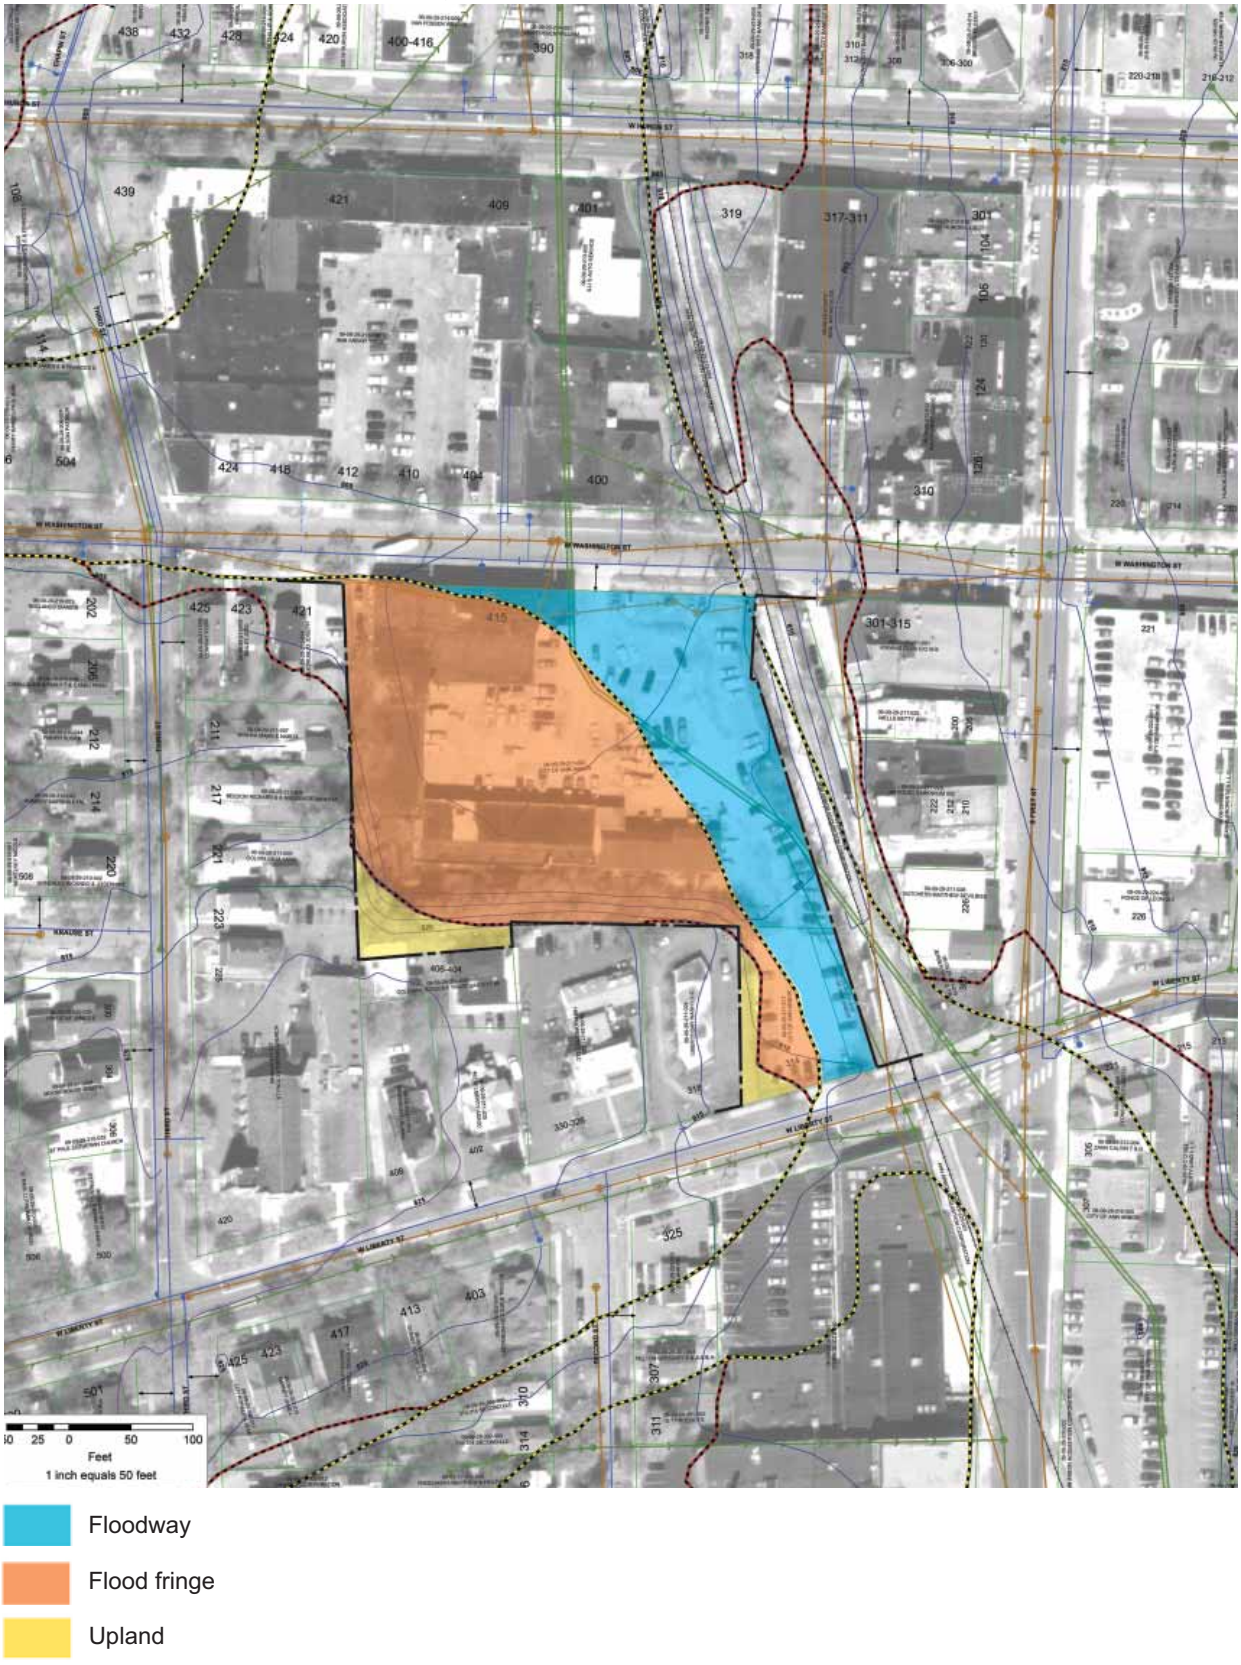
Phase 3 (long term)

- Complete remediation and landscape features.
- Install greenway path(s) and other improvements.
- Continue programming efforts to develop/sustain Greenway uses and site specific uses.

Summary

The Task Force's recommendation for use of this one acre, largely floodway, parcel is permanent open space and part of the larger Allen Creek Greenway. Reasons include its location, its floodway characteristics, and its potential value as an open space when thinking about the City center holistically. Conversion of this surface lot to Greenway garden is an important early step in creating a visible open space destination, stimulating adjacent private property improvements, and positively altering the character of this part of the City.

Surface Hydrology on the 415 W. Washington Site



City offices and maintenance lot on Washington

City-Owned Site #2 ~
415 W. Washington, City Maintenance Garage

Existing Conditions

Location: South side of W. Washington St., between First and Third Sts.; in the OWS Historic District and the DDA District; adjacent to the CBD.

Current use: City-owned fleet maintenance and office facility; main building used as office space by City Parks staff. City plans to relocate its functions from the site by fall 2007.

Floodplain and Upland

The land is divided into:	Acreage	% of total
Floodway	0.81 Ac	32.4%
Flood Fringe	1.53 Ac	61.2%
Upland	0.16 Ac	6.4%
	2.50 Ac	100%

This site is in the floodplain conveyance zone of the Allen Creek valley. Due to the potential risk and liability associated with new or existing buildings in a floodplain, development is controlled by State and Federal laws and required to meet specific regulations.

Allen Creek Drain: The drain enters the site at its eastern edge, approximately one-third of the way into the site from the south, and is contained within the floodway zone. The County drain is a large 7'x9' box culvert between 1' and 3' below grade and sitting within a 60' easement controlled by the Drain Commissioner. This site can accommodate rainwater quality BMPs within the flood fringe and, potentially, first flush and runoff storage of 12,255 cubic feet, or 90'x90'x1.5' deep.

Topography: The railroad embankment lies at the eastern boundary, approximately 12-feet high at Washington St. and falling to ground level at Liberty St.; approximately 25-foot high steep slopes at portions of south and west boundaries; grading generally slopes down to a relatively flat central area that is the lowest point with a largely consistent elevation along Washington St. In effect, the site is bounded by sloping edges on the east, south and west. A narrow strip of the parcel fronts onto Liberty St. and provides a continuous link north to Washington St.

Vegetation: Plant material on site is minimal; what does exist are pioneer and invasive species.

Soils: The site is disturbed urban fill soils.

Environmental status: Past contamination by leaking underground gasoline storage tanks has been remediated and tanks removed; contaminate concentrations are significantly reduced but levels are not below residential cleanup standards, site has not reached closure; ongoing contaminate source may be off-site, additional investigation and possible remediation may be needed if site is to be reused.

Existing buildings: The site contains several aged buildings; the Washington St. building is the most substantial; its redevelopment viability and the cost to bring it up to building code compliance are unknown.

AARR tracks looking North to the embankment

Adjacent property uses: North: YMCA across Washington St.; Northeast: Ashley Terrace (93 units proposed) across Huron St. at First St.; East: AARR right-of-way with office/commercial east of the future mixed-use project at First and Washington Sts. including residential units; South: possible commercial properties and 68-unit Liberty Lofts condominiums (Eaton Building) across Liberty St.; West: older residential dwellings and church; the OWS Historic District to the south and west.

Notable features: The site's built conditions, primarily the architecture, by nature of being within the OWS Historic District, require Historic District Commission approval of any proposed building modifications or removals; and, the Liberty St. frontage and elevation, along with the openness of the railroad right-of-way looking south from Liberty St., put 415 W. Washington site in visual contact with the First and William Greenway site. Their proximity to each other and to the Liberty St. corridor could provide for visual and physical connections beyond this site's property lines. Lastly, the success of the adjacent YMCA suggests consideration be given to its activities and this site's redevelopment program.

Upland

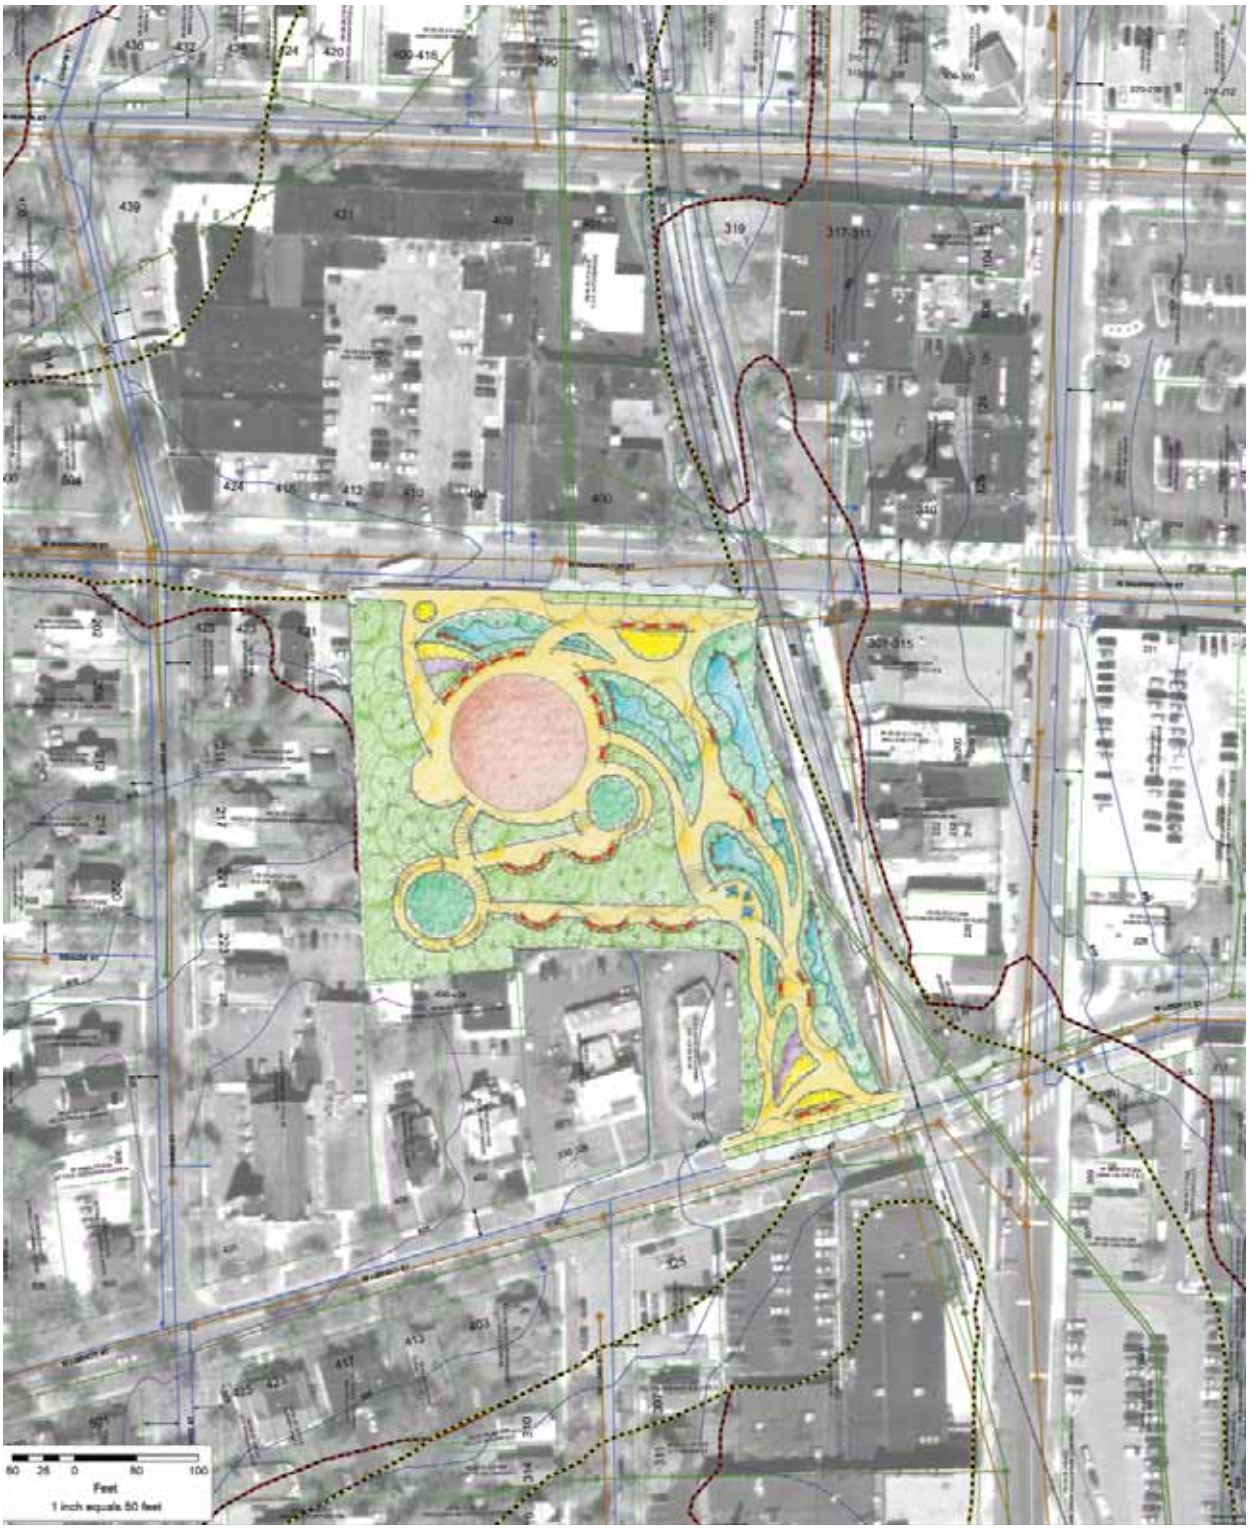
Alternative A ~
Greenway Art and Performance Park

This option accepts that responsible public policy does not allow new building construction in a floodplain. The City of Ann Arbor should set an example for ethical land use on property it controls.

Because of its setting between the heart of downtown and vibrant residential neighborhoods, this site is an ideal location to promote Ann Arbor's collective social and cultural life. Ann Arbor's core identity has long sprung from its cultural institutions, ranging from the thoroughly respectable to the wildly alternative. The community abounds with artists, arts advocacy groups, cultural organizations and institutions, patrons of the arts and committed art lovers. They are an important source of our reputation as a home for the uncommon, diverse, world class and cutting edge. Diversified and unusual venues for showcasing the arts enhance this identity. These are the motivations driving this proposal for a Greenway Art and Performance Park at 415 W. Washington.

Key Considerations

1. The current building fronting on Washington St. is a significant obstruction in the floodplain according to City of Ann Arbor staff.
2. There are viable underutilized developable sites that are outside the floodplain within a few blocks of the parcel.
3. The 1988 Ann Arbor Downtown Plan recognized this area as both interface and "natural buffer" between downtown and nearby neighborhoods and noted the "special topographic feature" of the Allen Creek valley for creating "improved entries to downtown" and "[enhancing] downtown's unique identity as a place".
4. Near the liveliest section of the Main St. business district, and immediately surrounded by a mix of uses (residential, retail, entertainment, recreational, office and others), this site will attract a diverse set of potential users.
5. The new YMCA has greatly increased activity and traffic in this area throughout the day and into the evening, during the week and on weekends.
6. The site's Liberty St. frontage and elevation, with the openness of the railroad right-of-way, puts it in visual contact with the First and William site. In turn, the visibility of this property from First and William emphasizes the continuous nature of the Allen Creek Greenway.



Pros

- Maximum open space for flexible public use
- Building removal maximizes floodplain flow

Cons

- All public investment; no economic gain

Design Intent and Rationale

This location, almost entirely within the floodplain, in the center of the transition zone between downtown and a historical neighborhood, and at the edge of an area of increasing residential density, drives our recommendation that this site be an open space park and open air art and performance venue. To accomplish multiple objectives and provide significant community-wide environmental, economic and social benefits, an open space design will

1. create unique destination space dedicated to supporting and showcasing the arts community, a key element of Ann Arbor's quality of life and identity as a vital, successful city;
2. manage rainwater and mitigate flood hazard by allowing flow through the conveyance zone to the Huron River;
3. prevent damage to buildings and their occupants by keeping the floodplain free of obstructions;
4. improve water quality by replacing impervious surface with rain gardens, bioswales and other appropriate methods to filter and cleanse rainwater;
5. transform an underused "no access" zone into an attractive and lively destination, designed to create community activity and promote non-motorized transportation;
6. maximize the physical extent and the visual and experiential impact of open space in the heart of the Greenway; and,
7. stimulate new edge development and complementary uses to the north, east and south of the site that will result in financial and other benefits to the City.

View South to Liberty Street

Committed and imaginative programming of regular events and special activities at this location is a crucial component of this proposal. This will require innovative partnerships between the City, non-profit and civic organizations, schools, other community institutions and private sponsors. The diverse and ever changing nature of what will appear in this public open air gallery and performance space will keep residents and visitors interested and prompt return visits. Such an unusual and visible venue for Ann Arbor's art and culture community so close to Downtown will become a key Greenway destination.

Program and Design Form

The Open Space Scheme removes all existing structures from the site, and is comprised of three basic elements.

View North to the YMCA

1. **A Greenway garden in the floodway portion of the site.** This garden will combine pervious ornamental paving with native plant rain garden “basins” to clean rainwater runoff. The east side of the site connects Liberty and Washington Sts. The primary Greenway path will be incorporated into this area, with lighting, seating, public art, signage and interpretive displays. The Liberty St. entrance will be a highly visible gateway. Connection to the First and William site will be emphasized by ornamental pavement treatments such as applied color, contrasting materials, and pavement embossing. Possible residual site contamination, if any, will be coordinated with removal of impervious paving and landscaping installation.
2. **A community Art Park in the main portion of the flood fringe area.** The Art Park will be a flexible venue for a changing schedule of public art work. This can include temporary art installations, performance art, small scale concerts and “low tech” theatrical performances. Landscaped areas, lighting and seating will be combined with an open, pervious surface performance plaza. Instead of any permanent structure, anchor connections can be embedded in the plaza to permit installation of temporary tent covering or light shelter as needed.
3. **A handicapped-accessible path that branches off from the Liberty St. entrance and runs along the south edge of the site.** To provide safe and universal access to and through this site, a ramp is necessary. City staff notes that a few feet of soil could be removed from most of this site, lowering the grade on the southern portion that extends to Liberty St. to improve the flood flow thorough a constricted area. Modification of site grading and rain garden excavation should also be calculated to facilitate the ramp design. The ramp should be designed to function as or incorporate informal seating.

Implementation Time Line

Phase 1 (short term)

- Site is public property and has no acquisition cost.
- Seek Historic District Commission approval to demolish all buildings and structures.
- Develop landscape design, including determination of type and degree of soil contamination, appropriate remediation plan and re-grading scheme.
- Initial phase installation of the floodway garden, Art Plaza and paths.

- Develop programming to establish a regular schedule of Greenway Art Park uses and events. Seek partnerships with the City, non-profit and civic organizations, schools, other community institutions and private sponsors.
- Develop private, public and non-profit funding sources for arts programming.
- Begin discussion with AARR to plan enhanced landscaping of railroad right-of-way, including small triangular plot at southwest corner of Liberty and First intersection.
- Implement ornamental pavement (painting or embossing) to indicate Allen Creek and suggest the Greenway across the Liberty and First intersection to link to the First and William.

Phase 2 (medium term)

- Continue installation of floodway garden, Art Plaza and paths.
- Install ramp.
- Continue to develop programming of Greenway Art Park and private, public and non-profit funding sources for arts programming.

Phase 3 (long term)

- Finish installation of complete design.
- Consider what modifications will be needed to work best with changes in immediate vicinity (completed Liberty Lofts commercial area, changes at “Brown Block”, changes in commercial uses along south boundary, etc.).
- Continue to develop programming and funding sources.

Summary

This site has tremendous potential to strengthen our community’s collective quality of place and quality of life as a public space that enhances everyday experience. A city with an active, varied, innovative and well-supported arts and culture scene is an exciting and competitive city that will draw residents, visitors, businesses and investment. This provides strong support for the viability of the “place making” goals of this design. Selling this publicly-owned floodplain parcel for short term gain would be an irreparable loss. The psychological, social and economic benefits of green “real places” dedicated to community activity in the midst of where people live and work are incalculable.

View to the Southwest

Pros

- Architectural history preserved with adaptive reuse
- Known building mass/volume
- Minimum disturbance during construction

Cons

- Viability of existing buildings
- Economics ~ is rehab financially sound?
- Existing floodplain obstructions

Floodway

Flood fringe

Upland

Washington Street historic structure

Alternative B ~ Retain Current Structure ~ Community Building

The site at 415 W. Washington is in the OWS Historic District; the primary building may have historic significance. For this reason alone, there may be an argument that the building should remain in place. Another rationale for maintaining the current structure has been provided by a variety of artists, artist organizations and other non-profit entities such as Kiwanis, many of which have expressed a desire to maintain the building for use by their respective organizations. There was significant participation by the arts community at the public comment section of our Task Force meetings, the Public Process meetings held by the Task Force, as well as written communications to the Task Force. The Arts Alliance states that the City of Ann Arbor "provides surprisingly little support for its artists and cultural organizations… A community cultural facility has the potential to positively impact downtown Ann Arbor. Similar facilities (renovated warehouses, factories, etc.) have spurred economic vitality in a number of ways."

Design Intent and Rationale

With this strong public sentiment that the buildings retain value to the community, the Task Force has included an option that retains the current structure on the site. Only a small corner of the existing Washington St. building is in the currently delineated floodway.

The City should hire a structural engineer to determine the condition of the current building and the cost to rehab it. If the report indicates that the building is structurally sound, the report should be made available to any interested organization.

The City could either lease the property for a nominal fee or sell the property at full market value. In all cases, the property should be bound with a deed restriction that calls for the floodway portion of the site to forever be maintained as a public greenway.

Program and Design Form

Because there are multiple organizations that have shown interest in this site, the City should issue an RFP to non-profit organizations. The following criteria should be used to evaluate the proposals:

1. Must show how the re-use plans and design form for building and site express this location in both the Allen Creek valley and the Greenway, and a design which will

Second floor corridor

Interior of main garage

facilitate use of the floodway for paths, sitting areas and appropriate plantings.

2. Must show a development and maintenance plan, including financials, for the floodway as a permanent public greenway which include water quality BMPs such as rain gardens and bioswales, and contains the volume required to control first flush rainfall runoff from within the site.
3. Must demonstrate and quantify rainwater runoff improvements and benefits with the site re-use.
4. Must demonstrate activation of the area and how the presence of the organization provides for “eyes on the park.”
5. Must demonstrate clear community benefit to the greatest extent possible, including quantifiable measures of the number of people using the site, the number of hours a week the site is activated as well as the financial return and economic benefits to the City.
6. Should demonstrate synergy with the YMCA and the downtown.

Summary

The City can satisfy numerous community goals by electing to allow the current structure to remain in place at this site. The exterior facade can be restored using historic guidelines, maintaining the values of the historic district. The arts community could have a facility that will act as the cultural center for many different organizations. This publicly owned property would remain in the public domain. The western edge of the downtown will be activated, enhancing the area and contributing to a vibrant and exciting urban core. Perhaps most importantly, a segment of the Allen Creek Greenway will be created, maintained and supplied with a ready audience of participants.

View looking Southwest from Washington Street

Floodway

Flood fringe

Upland

Alternate C ~ New Housing and Additional Open Space

The inclusion of this site in the DDA District is the result of a view offered in the initial 1982 DDA Plan, that a City maintenance garage at this location was not likely to be the long term and final use of the property.

Key Considerations

This 2½ acre parcel is possible to describe as limited in its presence, direct influence and impact on Ann Arbor's CBD. Located to the west of a railroad embankment, the site is physically, if not placed by one's perception of it, more into the OWS residential neighborhood than within the dynamics of the City's downtown. Reinforcing this mindset is a history of the City's planning documents dating to the early and mid-1970s expressing caution about the tendency to expand downtown's activities into the Central Area's close-in residential neighborhoods.

Committing the site's floodway as a core component of the Allen Creek Greenway, and using approximately 1.30 acres of the available 1.69 acres of flood fringe and upland for building new housing, result in a site that is almost equal in area for new residential architecture and expanded open space. The Greenway allocation grows from the 0.81 acre floodway to 1.2 acres of paths and gardens, or almost half the total site.

Design Intent and Rationale

The addition of both housing and open space at this location should result in

1. adding new residents in close proximity to the downtown while placing them in the desirable OWS residential atmosphere;
2. taking advantage of the Greenway's potential for adjacent property value increase and development opportunities on the City's site resulting in less impact on the dominant and more pure single family character a short distance to the south of Liberty and west of Third St.;
3. introducing housing and open space into the block provides for additional eyes on the Greenway without affecting the YMCA's pattern and timing of activities, since housing typically moves on a different and complementary schedule;
4. stabilizing the mixed use character of adjacent properties

Pros

- Potential for City revenues and use of Brownfield funds
- Affordable housing opportunity
- Provides “eyes”
- Improves floodplain flow

Cons

- Risk of living within/above floodplain boundary
- Parking on the ground floor

fronting on Liberty St., and leading them toward a higher quality outcome more consistent with the architectural and site/landscape characteristics of Liberty Lofts, St. Paul Evangelical Lutheran Church, and the YMCA; and,

5. using the development value of the property for Brownfield funding, Greenway construction and open space maintenance over time. The possibility exists to improve the area beyond the site's legal boundary, i.e., to use the financial potential of this site to help fund the First and William site's conversion to Greenway.

Program and Design Form

Looking South into the maintenance yard

The characteristics of the approximately 1.2 acre open space should be consistent with the intent previously expressed by the Task Force's consensus recommendation for program and design form of First and William: open space uses and activities placed into the land in patterns that invite and then shape experience.

1. **Program within Floodway**

An urban garden and open space with a network of paths for recreation; rain gardens for water quality improvement; and areas for sitting, gathering and flexible activities and exhibits are among the possibilities.

2. **Program beyond the Floodway**

The potential is for residential uses above with parking below, on ground level and contained within the building footprint. Also to be considered are common spaces within the housing and outside on-site, the latter being open space on-grade, and with green roof treatments at plaza and rooftop levels.

More specifically, the intent of the design guidelines illustrated by the concept for this alternative includes

1. stream-like, meandering lines of movement as pathways, rain gardens, activity areas and other rainwater BMPs, all using forms mimicking the flow of water;
2. form and layout of buildings and site integrate with and respond to the Allen Creek Greenway's open space on-site, and linked to off-site connections;
3. building and site design that meets or exceeds Federal, State and local floodplain laws and requirements;
4. links between ground level and upper residential plaza levels for circulation/movement as well as light and air flow;
5. references to architectural past, including the possibility of "deconstructing" the Washington St. facade so as to retain

its structural elements while placing new architecture to the south, set back from the original building remnant;

6. green building requirements including little to no rain-water runoff;
7. sequence of spaces from public to semi-pubic to semi-private to private;
8. buildings that encourage use of the Greenway and express interaction; and,
9. design expression that addresses its location yet looks past the site's property lines.

Implementation Time Line

Phase 1 (short term)

- Upon completion of the City move to the new garage in fall of 2007, relocate site perimeter fencing to secure the building complex and open passageway from Liberty to Washington, making modest improvements to the paved surface to facilitate safe travel.
- Discuss and finalize the approach to use of Brownfield funding to remove remaining soil contaminants on this and First and William sites.
- Discuss and finalize the residential program for overall number of units including percentages of affordable, work force and market rate housing.
- Discuss and develop metrics for financing, developer maintenance of the adjacent Greenway, relationship of housing to the Greenway and the general vicinity, and revenue generation.
- Develop an RFP for a public-private partnership to move forward with planning, design and implementation of the Greenway and new housing proposal.

Phase 2 (medium term)

- Issue the RFP, evaluate responses based on accessing Brownfield funds, housing program, Greenway implementation, and other factors identified during the RFP process, and select the most advantageous proposal.
- Developer to proceed with design, seek required City, County and State approvals prior to proceeding with construction.
- Implement Greenway and housing consistent with plan and permits as approved.

Phase 3 (long term)

- Initiate agreement between City and housing association to

monitor, manage and maintain the Greenway and housing's adjacent open space.

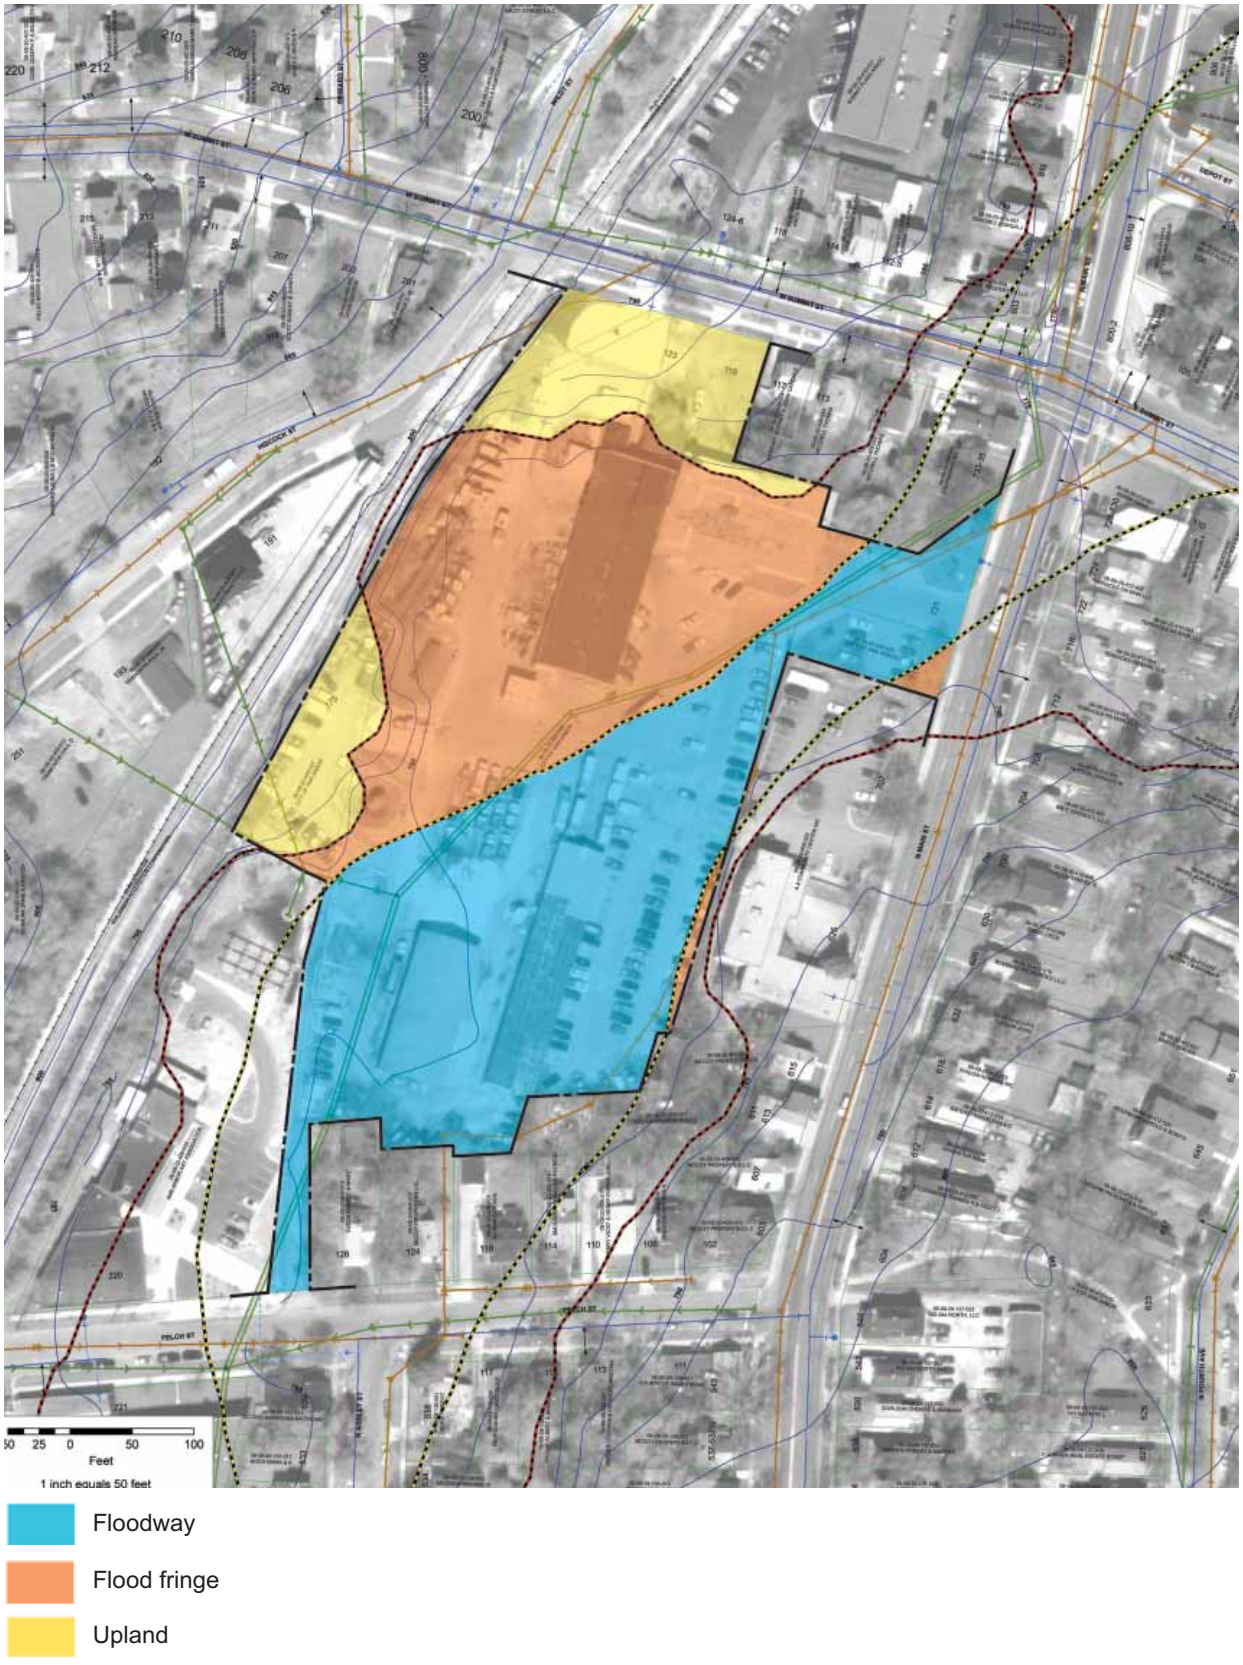
- Jointly monitor rainwater runoff BMPs for any needed changes.
- Jointly monitor and adjust programming of the Greenway's open spaces if/as needed.

Summary

Selection of this alternative to use 415 W. Washington to both expand the Greenway beyond the floodway and provide a variety of housing types takes advantage of the site's location, the potential for the City to gain financially, and to possibly rely on a public-private partnership to develop and care for this section of the Allen Creek Greenway. This alternative adds new residents in close proximity to the downtown without pressuring the integrity of the OWS Historic District or conflicting with activities at the YMCA. Financial gains from private development can be integrated into the broader picture of soil contamination and remediation on all three of the City-owned sites as the Greenway is developed. The adjacency of 415 W. Washington to First and William site, being literally across from each other on the north and south sides of Liberty St., suggests concurrent implementation if at all possible. Sharing the W. Washington's 2.5 acre site for both public open space and private mixed unit housing makes the potential of joint construction more likely.

Looking North across Liberty Street

Surface Hydrology on the 721 N. Main Site



721 N. Main in context

City-Owned Site #3 ~
721 N. Main, City Maintenance Garage

Existing Conditions

Location: West side of N. Main St., between Felch St. (to the south) and W. Summit St. (to the north).

Current use: City-owned fleet services yard. City plans to relocate its functions from the site by fall 2007.

Floodplain and Upland

The land is divided into:	Acreage	% of total
Floodway	2.44 Ac	47.9%
Flood Fringe	1.96 Ac	38.4%
Upland	0.70 Ac	13.6%
	5.10 Ac	100.0%

This site is in the floodplain conveyance zone of the Allen Creek valley. Due to the potential risk and liability associated with new or existing buildings in a floodplain, development is controlled by State and Federal laws and required to meet specific regulations.

Allen Creek Drain: Drain enters at narrow southern Felch St. frontage and roughly follows west floodway boundary largely within the floodway zone, exits the site at N. Main St.; top of the drain is approximately 2 feet below ground level. The Office of the County Drain Commissioner will not permit building directly over the drain and requires a 60-foot wide easement centered on the drain; any development cannot impede access to or the functioning of the drain.

Topography: Site is partially bounded by the 20-foot high AARR embankment to the west and a 20-foot high slope to the north at W. Summit St.; interior of the site is largely flat, with 2 feet of fall between Felch St. on the south to N. Main St. on the northeast.

Vegetation: Plant material on site is minimal; here, too, what does exist includes pioneer and invasive species.

Soils: The site is disturbed urban fill soils.

Environmental status: Site has been remediated and meets the standard for unrestricted residential use.

Existing buildings: Site contains four primary garage and warehouse-like structures; all are in the floodplain, as are

Ann Arbor Art Center

Ann Arbor Community Center

several other small multi-purpose storage sheds. Existing buildings are in poor condition as judged by City staff; the buildings are assumed to be non-Code compliant; and, the cost to renovate any of these buildings for legal occupancy and Code-compliance is currently unknown. City staff says removing these structures would improve the floodplain management in this location. Pavements are either hard packed gravel or asphalt, and impervious.

Adjacent property uses: AARR's right-of-way to the west, both sides of the track, are used for operations and maintenance purposes and forms the northern portion of the western boundary; the Ann Arbor Art Center offices and classroom building are to the west; the Ann Arbor Community Center building and parking lot is to the east; the Beal Construction offices and studio complex are south across Felch St.; individual residential properties are located to the south, southeast and northeast; the SBF single family neighborhood is to the west; and the NCPOA is east of Main St.

Notable features: The site's size, its location close to the Huron River, and its frontage on Main St. suggests opportunities that are different from the other two City-owned sites. An opportunity exists for coordination with future development and renovation plans of both the Ann Arbor Community Center and the Ann Arbor Art Center. While access north to the Huron River Greenway is currently complex with the only official railroad crossing being at Lake Shore Dr., the Greenway access route south toward City-owned sites 1 & 2 can occur along Ashley and First. This site's connection to W. Summit St. can provide access to property owned by the Elks who have graciously allowed entry onto their land and into Bluffs Park. Such cooperation might be continued more formally as the Elks property is currently undergoing redesign.

Alternative A ~
Open Space Design: Community Green

Ann Arbor has a reputation for environmental stewardship and a growing commitment to sustainable practices. This site offers the City a unique opportunity to put this commitment into practice by preserving this large floodplain parcel in its entirety as Greenway open space.

> "We have reached the point where we need to think about what kind of environmental future we're going to have. I believe we can live in harmony with our environment; we don't have to go out there and pave every square inch. But we need a new ethic for living in our world."
> *-Chuck Flink, founder of Greenways Incorporated, as quoted in Greenways for America, Charles Little, 1990*

Key Considerations

1. Because of its size and location so near the Huron River, it is especially important to optimize the hydrological functioning of this floodplain area. River water quality will benefit directly.
2. New construction in the floodplain is poor public policy. The City, as the steward of the public good, should set an example for ethical land use.
3. The site is adjacent to the intersection of West Summit and N. Main streets, a primary "gateway" to Ann Arbor and Downtown from interstate highways. This is an area long considered in need of substantial improvement to create a distinctive and attractive entry to the city.
4. The site offers the potential of forming a green bridge between the city and the parks and trails along the Huron River.
5. The site is located directly between established single-family neighborhoods and a portion of N. Main St. poised for significant new development, as indicated by parcel consolidation shown on property tax records. Public green open space can serve both areas, and function as an attractive transition and linkage between them, as anticipated in the 1988 Ann Arbor Downtown Plan.
6. The site is surrounded by a mix of uses within a two-block radius: single family residential, non-profit, arts, community, retail, commercial and office, thus providing a diverse set of potential users.

Pros

- Diverse recreation potential
- Building removal/deconstruction improves floodplain flow
- Water quality benefits
- Interprets site history

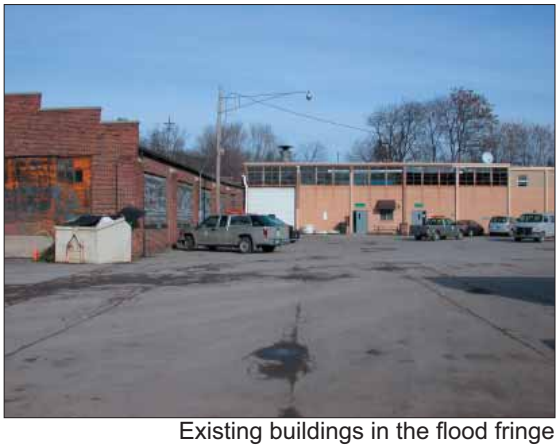
Cons

- Isolated, lacks “eyes”
- All public investment; no economic gain
- Lacks rail & bus transit facilities

7. The site's size and relative separation from its larger residential neighborhood surroundings offer opportunities that are different from those possible on the other two City-owned sites.

Design Intent and Rationale

The large size of this site, and its location at a gateway to the city, in a transition zone between established neighborhoods and an area that is moving towards increased development, drives our recommendation for total open space use.



Existing buildings in the flood fringe

To achieve important objectives and provide a variety of community-wide benefits, an open space design will

1. create a welcoming gateway on a major access route to Ann Arbor and provide connectivity for non-motorized transportation;
2. provide opportunities for active recreation only a few blocks from downtown and lacking elsewhere in the City;
3. manage rainwater and mitigate flood hazard by allowing flow through the conveyance zone to the Huron River;
3. improve water quality by replacing impervious surface with rain gardens and bioswales planted with appropriate vegetation to capture, filter and cleanse rainwater;
4. preserve public safety by not putting work places or residences in a location that is hazardous in the event of a flood;
5. transform a "no access" zone into a lively, green open space dedicated to improving the health and well being of residents and providing a venue for communal public activities; and,
6. stimulate new edge development and complementary uses along Main St. that will result in financial and other benefits.

Incorporating this site commits to the generous vision of the Greenway that Ann Arbor deserves. Its size will permit more creative approaches to water quality management, as well as make it suited to active recreation programming. Its proximity to the Ann Arbor Art Center, the Ann Arbor Community Center and the Dance Gallery Foundation provides an opportunity for coordination of arts and civic programming. The combination of uses and activities will evolve over time if options for future use are not limited.

Program and Design Form

The Open Space design removes existing buildings at the north

end of the site and retains the two frame structures at the south half for adaptive re-use. It is comprised of two basic elements:

1. **Interpretive Creekshed Garden.** This garden, incorporating the entire floodway, will combine pervious ornamental paving, soft surface paths and boardwalks with a showcase system of native plant rain gardens and other innovative means to cleanse rainwater runoff. The functional aspects of this garden, as well as the history and importance of the Allen Creek watershed, will be articulated through interpretive displays and signage. Opportunities for water-based recreation should be considered, for example a shallow splash pool that converts to an open-air skating pond in the winter. Two existing buildings could be deconstructed to become pavilions. The primary Greenway path, with coordinated lighting and seating, will connect Felch St. to N. Main St. and will be incorporated along and into this major garden area.

   Site entrances at N. Main and Felch St. should be highly visible and ceremonial. Currently the Felch St. access has a narrow frontage, but is adjacent to a parking lot owned by the Ann Arbor Art Center. The City should investigate a cooperative arrangement with AAAC to develop the Felch St. entrance.

Looking North from Felch Street

2. **A Community Green.** A small amphitheater could be incorporated at the high end of the site at W. Summit St. providing a panoramic view. The grade change may also make portions of the parcel ideal for a skateboard park. Community gardens might be planted in raised beds in the flood fringe conditional upon compensatory excavation in the floodway. The flood fringe might also accommodate a fenced dog park. Existing pieces of “industrial archaeology” such as the elevated railroad siding and a tall storage tank can be retained for their unique character and incorporated into a fitness course.

   The non-floodplain portion of the site on Summit St., although small, might be appropriate for creatively designed housing or community use that fronts on the Greenway.

Implementation Time Line

Phase 1 (short term)

- Site is public property and has no acquisition cost.
- Demolish buildings and structures per design; retain identified structures and site features.
- Install initial phase of floodway garden and paths.

- Develop programming to establish a regular schedule of Greenway uses and events. Seek partnerships with Ann Arbor Community Center, Ann Arbor Art Center, Dance Gallery, recreational groups, public arts groups, neighborhood associations, civic groups, public schools and local businesses.
- Develop funding sources for activity programming.
- Work with AARR to landscape railroad right-of-way.

Phase 2 (medium term)

- Continue installation of the floodway garden paths.
- Begin installation of active recreation facilities and "community green" areas.
- Continue to develop programming and funding.

Phase 3 (long term)

- Complete final installations.
- Make modifications as needed in response to changes in immediate vicinity (development on N. Main, connections to Bluffs Park, etc.).
- Continue to develop programming and funding sources.

Summary

> "Make no small plans. They have no magic to stir humanity's blood and probably themselves will not be realized. Make big plans; aim high in hope and work, remembering that a noble, logical plan once recorded will never die, but long after we are gone will be a living thing, asserting itself with ever-growing insistency."
> *– Daniel Burnham; American architect and city planner, 19th Century*

This site should be meaningful to all Ann Arbor. Positioned at a main entry to the City, it will be the link between the Allen Creek Greenway and the Huron River Greenway and provide connection to the county-wide Border-To-Border Trail network. This important location should be conceived of as a grand and memorable portal that speaks volumes about Ann Arbor's vision for a sustainable and livable future.

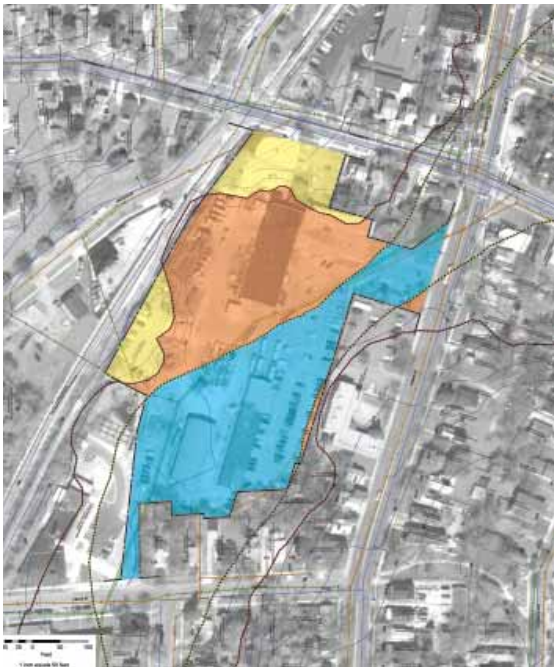
Open space use of 721 N. Main commits to a "big plan" vision of the Greenway and keeps the door open to future possibilities. We must accept the challenge of planning for a future that we would wish to provide for our children's grandchildren. If fully realized, the Allen Creek Greenway will be an enduring and enriching legacy.

Pros

- Facilitates rail and bus transit
- Potential for City revenues and use of Brownfield Funds
- Provides activity/"eyes" with mixed use development
- Possible stimulant for additional developments

Cons

- Mixes motorized and non-motorized uses
- Adds new building within the floodplain
- Potential neighborhood impacts and opposition



Floodway

Flood fringe

Upland

Alternate B ~ New Mixed-Use Neighborhood and Additional Open Space

This site's notable features of size, location, degree of separation from its surroundings by the railroad embankment and primary streets, and the mixed-use qualities of its immediate neighbors, combine and point to the ability of this property to absorb new mixed-use development and additional open spaces for Greenway use beyond those contained within the floodway.

Key Considerations

With the departure of the City to a consolidated service center elsewhere, this site is land with the potential to be another active "neighborhood", and a key active and passive open space component of the Allen Creek Greenway. Mixed-use development is illustrated on approximately 2 acres of the 5.1 acre site. This expands the Greenway open space by 0.66 acres, from the 2.44 acre floodway to 3.1 total acres, or 60% of the site.

Location and elevation of the railroad track, and the site's proximity to Depot St. for cross-town access to the Medical and Central Campuses, make this location a candidate for a primary passenger rail stop coordinated with AATA/U-M bus service.

Design Intent and Rationale

Providing a mix of uses and activities such as office, cultural, modest amount of commercial, residential, and a possible passenger train station with a bus transfer facility, and all fronting onto the Greenway with its expanded open space, will

1. place people directly on and into the Greenway;
2. take public advantage of the potential rise in property value and investment with the open space commitment;
3. demonstrate to owners of adjacent warehouse and industrial property, the possibilities of mixed use and higher density with green building principles proposed for "green" developments within City limits; and,
4. as per the housing proposed for part of the 415 W. Washington site, use the financial potential of the land to access Brownfield funding to help support soil remediation, and private and public property improvements.

Program and Design Form

Improvements to the expanded, approximately 3.1 acre

available open space should be in keeping with the Task Force's consensus design criteria suggested earlier for the floodway portions of First and William and 415 W. Washington sites: open space uses and activities placed into the land in patterns that invite participation, and then shape experience and offer learning. The opportunity exists to keep some of the current structures, although in a modified and deconstructed form of posts or columns and roof for floodway and flood fringe benefits, and use them for recreation and as components in an environmental education/interpretive program of the site's history.

1. **Program within the floodway**
   Open space potentials range from a network of paths for access, rain gardens for water quality improvements, and community gardens to passive and active recreation activities, picnic shelters, and areas for sitting, gathering and flexible activities and exhibits.
2. **Program beyond the floodway**
   Some additional open space as an extension of the features described above might include a mixed-use complex with parking for cars, buses and bikes on the ground level with an additional one or two floors of parking and a variety of uses from office to cultural/exhibit/performance spaces, support retail and residential above the parking. Common spaces inside and on-site, utilizing green roof principles for design of plaza levels and rooftops, offer another means of adding open space.

In more detail, the intent of Alternative B's design as illustrated includes

1. meandering stream-like lines of movement as pathways, rain gardens, activity areas and rainwater BMPs, all using forms mimicking the flow of water;
2. form and layout of buildings and site that integrate with and respond to the Allen Creek Greenway's open space on-site, and are linked to off-site connections;
3. building and site design that meets or exceeds Federal, State and local floodplain laws and requirements;
4. references to architectural past, including former storage sheds that, with deconstruction, could become shelters and interpretive stations;
5. green building requirements including little to no rain-water runoff;
6. vehicular access to the parking deck from W. Summit, with buses entering the transfer point from W. Summit and departing via Main St. (for eastbound Depot St. or

Looking North to Summit Street

southbound Main St.) and limited ground level vehicular parking access from Main St.;

7. a rail passenger terminal and covered platform trackside, and interior connection to a covered bus transfer point at grade level;
8. improved Greenway frontage, with visual and physical access into the site from Main St. as part of the Greenway's presence on this main artery;
9. sequence of spaces from public to semi-pubic to semi-private to private; and,
10. buildings that encourage use of the Greenway and express both the open space and their presence in the Allen Creek valley.

Implementation Time Line

Phase 1 (short term)

- Upon completion of the City move to the new garage in fall of 2007, relocate site perimeter fencing to secure the site while allowing space for improvements to the frontage on surrounding streets.
- Discuss and finalize the approach to use of brownfield funding to remove remaining soil contaminants on the three City sites.
- Discuss and finalize the mixed-use program including overall number of residential units, and percentages of affordable, work force and market rate housing.
- Discuss and develop metrics for financing, possible developer maintenance of the adjacent Greenway, relationship of new mixed-uses to the Greenway and the general vicinity, and revenue generation.
- Develop an RFP for a public-private partnership to move forward with planning, design and implementation of the Greenway and new mixed-use proposal.

Phase 2 (medium term)

- Issue the RFP, evaluate responses based on accessing brownfield funds, housing program, Greenway implementation, and other factors identified during the RFP process, and select the most advantageous proposal.
- Developer to proceed with design, seek required City, County and State approvals prior to proceeding with construction.
- Implement Greenway and housing consistent with plan and permits as approved.

Phase 3 (long term)

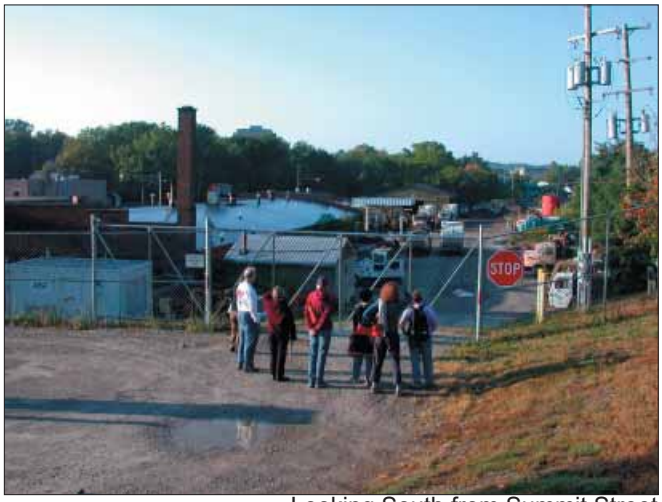
- Initiate agreement between City and housing association to monitor, manage and maintain the Greenway and housing's adjacent open space.
- Jointly monitor rainwater runoff BMPs for any needed changes.
- Jointly monitor and adjust programming of the Greenway's open spaces if/as needed.

Summary

View East to Main and Depot Streets

The soon-to-be vacated N. Main St. City maintenance garage, as a larger property in this location, presents greater open space and mixed-use development possibilities, and a more complex public-private partnership set of relationships and dependencies. A longer time frame to conceive, confirm and implement any proposal is likely. Two benefits can result: an added opportunity to consider the Allen Creek Greenway's connections to the Huron River, which involve MDOT and the Norfolk Southern Railroad, and, the sequential phasing of changes to the three City sites. The 5.1 acre N. Main site can also accommodate and integrate its two institutional neighbors (Art Center and Community Center) into the changes.

The history of this City site can remain to tell one side of an environmental tale as the new buildings' and the site's qualities speak to one another. Alternate B, as presented, has the potential to be integrated into Ann Arbor in both time and place.



Looking South from Summit Street

Section 4. Implementation

First and William

415 W. Washington

721 N. Main

Section 4. Implementation

The Allen Creek Greenway is an idea and an opportunity. The Task Force was charged by City Council to substantiate the Greenway's potentials and, in effect, consider to what degree the three City-owned sites might become initial components of a recreation and transportation corridor in the Allen Creek valley.

In so doing, ideas for the Greenway's activities, amenities and facilities, were collected, discussed and narrowed to the potentials presented in Section 3. Recommendations exist where consensus was reached; alternatives reflect different points of view found for how the three City sites can be used to benefit a Greenway.

The Task Force's recommendations are

1. **First & William**, Parking Lot
   The Task Force consensus recommendation for First and William is its conversion from parking lot to "urban garden", with the possibility of including a passenger rail stop, if north-south passenger service is implemented.

2. **415 W. Washington**, City Maintenance Garage
   There are three options for the area beyond the floodway at the City maintenance garage at 415 W. Washington:
   a. all open space,
   b. re-use of the existing primary building, and
   c. new residential buildings and additional open space;

3. **721 N. Main**, City Maintenance Garage
   There are two options for the area beyond the floodway at the City maintenance garage at 721 N. Main:
   a. all open space, and
   b. new mixed use buildings and additional open space.

4. **Connectivity**, existing rights-of-way
   There are initial opportunities to link the City's three sites to each other and to the Huron River Greenway, using the City's streets and sidewalks in the public rights-of-way.

Next Steps

The process of implementing the Greenway should begin when the City consolidates maintenance functions to its Pittsfield Township facility in the fall of 2007 and two of the three City sites become vacant property. More specifically, the Task Force recommends the following sequence of actions.

Sites for Fall 2007 improvements

1. **Site improvements** to both First and William and 415 W. Washington should occur very soon after the W. Washington site is vacated, with construction occurring concurrently. Initial landscape and access enhancements will facilitate the public's safe use of the land for visual and physical access.
   - **First and William** improvements could include modest parking lot reconfiguration, symbolic water flow imprinting in the remaining pavement as per plan, the Ashley Street pocket overlook park, and Greenway interpretive signage.
   - **415 W. Washington** improvements include security fence relocation, pathway surface and seating between Liberty and Washington, new plantings along street frontages, and Greenway interpretive signage.

   City Council (aided by Administration, Parks, and DDA) affecting literal physical changes to these two sites can help to collect and direct community thinking about possibilities, and demonstrate Council's willingness to engage in needed decision-making.
2. Planning Commission and City Council should guide dialogue about **floodplain and development policy** so that use of the three City sites beyond the floodway can be decided. The community's collective voice and Council's resolution of the choice between either allowing new buildings to be built (or existing buildings to be rehabbed and reused consistent with applicable laws and requirements) or no longer permitting any architectural development in a floodplain.
   - Review of new and emerging floodplain data for its possible implications and impacts is a necessary part of the decision process.
3. A three-site **assessment of soils and remediation** involved should be conducted by the City, and the potential for use of Brownfield funding investigated.
4. An **existing building analysis** of 415 W. Washington and 721 N. Main including structural condition, HAZMAT issues, and other factors should be undertaken by the City.
5. City Council, with possession of the above findings 2, 3 and 4, and any other information gathered as needed, should engage in a **dialogue about the recommendations and alternatives** for City-owned land, and reach a decision.
6. City Council (aided by Administration, Parks and DDA)

should deliberately **pursue new and continuing discussions** with both railroads, MDOT and The University about a longer term vision of an off-road Greenway in the Allen Creek valley.

7. And, finally, the City should develop **a list of other public and private parties** with an interest and a role to play in the Greenway, and continue to move forward with the process of planning, design, funding and implementation.

The above offers a guideline for implementation of the Allen Creek Greenway, beginning with initial improvements to signify its beginning. Policy determinations, acquisition of additional site information, and consideration of funding alternatives complete the agenda for Council in order to conclude its decision-making for a larger scale and scope implementation of the Greenway.

Funding the Allen Creek Greenway

Development of the Allen Creek Greenway will face funding challenges similar to those of the other parks, trails, and greenways incorporated into the City's parks and open space system, and potential sources of funding are similar. Funding requirements fall into three cost categories:

- **land acquisition and easements**
- **park and trail development**
- **on-going management and maintenance**

Land Acquisition and Easements

Dedication of public lands within the Allen Creek valley and funds from the Open Space and Parkland Preservation Millage (the "Greenbelt millage") are two possible tools available for acquiring land for the Greenway. Other potential funding sources include federal and state grant programs, public and private non-profit organizations, and potential partner institutions.

Dedication of Public Lands

Three variously sized parcels within the Allen Creek valley are already publicly owned. They total 8.60 acres consisting of 7.63 acres of floodplain (4.10 Ac of floodway and 3.53 Ac of flood fringe) and 0.97 Ac of upland potentially available for open spaces along the Allen Creek corridor with no acquisition cost.

Open Space and Parkland Preservation Millage

Funds from the 2004 Open Space and Parkland Preservation millage (a.k.a. the "Greenbelt millage") can be used for the purchase of conservation easements as well as additional

parcels along the Greenway. By resolution, Council guidelines state that 1/3 of the total millage revenues will be spent on land acquisition for the City's park system.

Total anticipated tax revenue from the 30-year millage is approximately $80 million. With the $20,250,000 bonded in 2005, the fund balance at the beginning of FY 2006-07 is $22,000,000.

Selected Federal and State Grants
Promising sources include

- Michigan Natural Resources Trust Fund
- National Park Service Land and Water Conservation Fund
- Pre-Disaster Mitigation Grant Program

Requirements and funding amounts for these sources can be found in the Appendix.

Other Potential Acquisition Mechanisms and Partners
The City can coordinate with the University of Michigan to determine feasible non-motorized routes through University properties and with the Ann Arbor Railroad for easements along the rail corridor.

The Allen Creek Greenway Conservancy, a new 501(c)(3) non-profit formed to raise funds for the purchase of land for the Allen Creek Greenway, may become a viable source of donated land in the future.

Park and Trail Development

Funding sources for the development of the Greenway parks and trails include the new parks millage, DDA TIF revenues, and various state and federal grants. Funds may also be raised from the sale of city properties which, in turn, could open up the possibility of Brownfield funding. New development within the downtown core or elsewhere in the watershed might be given the option to fulfill rainwater mitigation requirements on the three City properties.

Park Maintenance and Capital Improvements Millage
In November 2006, voters approved a new six-year 1.10 mill Park Maintenance and Capital Improvements Millage that is expected to raise $4,866,585 in revenue in fiscal year 2007-2008. According to the policy guidelines approved by City Council for the administration of the millage, between 60% and 80% of the revenues are to be used for park maintenance and repairs and between 20% and 40% for capital improvements.

Development of the Allen Creek Greenway trail system would fall into the capital improvement funding category of Pathways, Trails, Boardwalks, Greenways, and Huron River Watershed.

Development of destination open spaces along the Greenway would fall into the capital improvement funding categories of Active Parks, Neighborhood Parks, Urban Plazas, and Recreation Facilities depending on the design of the park.

With limited funds for capital improvements in each of these categories, and competing needs throughout the park system, a strategic plan and timeline will need to be carefully developed.

Downtown Development Authority
The DDA may contribute funds to finance development of portions of the Greenway within its district. The DDA may proactively establish a fund for Greenway development, and/or respond to proposals from the City, non-profit organizations, or neighborhood groups to fund specific Greenway projects. Such use of its funds conforms to its Downtown Development and Tax Increment Financing Plan for 2003-2033 which lists "support of the creation of an Allen Creek Corridor Land Use Master Plan conducted in collaboration with others, including the potential development of a system of linked open spaces and a pedestrian/bicycle path along the rail line and as rainwater runoff mitigation as a current priority."

Development of the Greenway can help the DDA fulfill some of its objectives stated in its plan:

- Encouraging the development of public land to meet community goals and attract people and businesses to downtown Ann Arbor.
- Mixed land uses that will promote a varied population throughout the day and night.
- Preservation of open space, natural beauty, historic buildings, and critical environmental areas.
- Sustainability as a fundamental tenet of downtown development to ensure requirements of the present are met without compromising the needs of the future.
- Enhancement of downtown's identity as a unique and special place.
- Fostering distinctive, attractive neighborhoods with a strong and unique sense of place.
- Participation of citizens and stakeholders in development decisions to foster involvement, ownership and pride in community.

415 W. Washington

721 N. Main

Mitigation Fund from New Developments
New development projects within the downtown core might be given the option to fulfill some of their rainwater mitigation requirements by contributing to enhanced mitigation effects on the City properties. This tactic would need to be used very carefully and only in appropriate situations.

Sale of Public Land
The City should carefully consider the costs and benefits of the sale of public land in the floodplain. The portions of the 415 W. Washington and 721 N. Main parcels that lie within the flood fringe but outside the floodway could be sold for redevelopment, with the revenues of those sales used to

- fund the development of Greenway open spaces in the floodway portions of the three City parcels;
- purchase land and/or easements to develop continuous linkages along the Allen Creek Greenway; and,
- fund other municipal projects.

If all or portions of the parcels are sold for development, a deed restriction can be put in place that requires the new owner to develop and maintain those portions of the land purchased as Greenway and requires all subsequent owners to maintain the Greenway as public open space in perpetuity.

When looking at this option, it must be recognized that there is limited opportunity for new land acquisition to provide open space needs within and near the downtown core. The 2003-2033 DDA Plan notes that nearly all of the DDA District is built up, with little property remaining for potential future open space, and that the City could be encouraged to consider the possible acquisition of private property to enable plans for open space to be realized.

Given these facts, sale of these public lands in and near the downtown core for any reason may be controversial. Public reaction will likely vary according to how the proceeds from the sale of these public lands will be used, i.e. whether used for Greenway and open space development or for other municipal projects. There is also some public sentiment that the sale of public lands in the floodplain for new development is especially problematic because of concerns about the impact of increased development within the floodplain on Huron River water quality, rainwater management, and flood hazard mitigation. At the same time, any redevelopment (public or private) of the three City sites results in environmental improvements as new development must meet all applicable codes, laws and regulations, and the existing City sites currently do not.

Consideration of the three City-owned sites as one

Brownfield TIF
The sale of a portion of the city parcels for redevelopment could trigger eligibility for tax increment financing for Brownfield redevelopment. Within the City of Ann Arbor, any property designated as 1) a "facility" or contaminated under state law, 2) obsolete, or 3) blighted may be eligible for Brownfield economic redevelopment incentives including Tax Increment Financing (TIF) or Small Business Tax (SBT) credits. Tax Increment Financing allows the Washtenaw County Brownfield Redevelopment Authority to capture new taxes on projects with an approved Brownfield Plan. Taxes may be captured for up to 30 years and the DDA has first right of refusal on the new taxes for projects within the DDA district. The contamination present at the First and William site could qualify it as a "facility."

To the extent the Allen Creek Greenway is developed as one large project, contamination in one portion of the "site" may create eligibility for Brownfield funding that can be used anywhere within the project's boundaries even if the sites are not contiguous, so long as the various sites complement the redevelopment. In other words, one portion of the site may be contaminated and planned for open space use (First and William) with no increase in the taxable value. However, another portion of the site (e.g. the flood fringe portions of 415 W. Washington or 721 N. Main) may include redevelopment that increases the taxable value and generate taxes that may be used for environmental remediation on the First and William site.

Selected Federal and State Grants
Promising sources of funds include

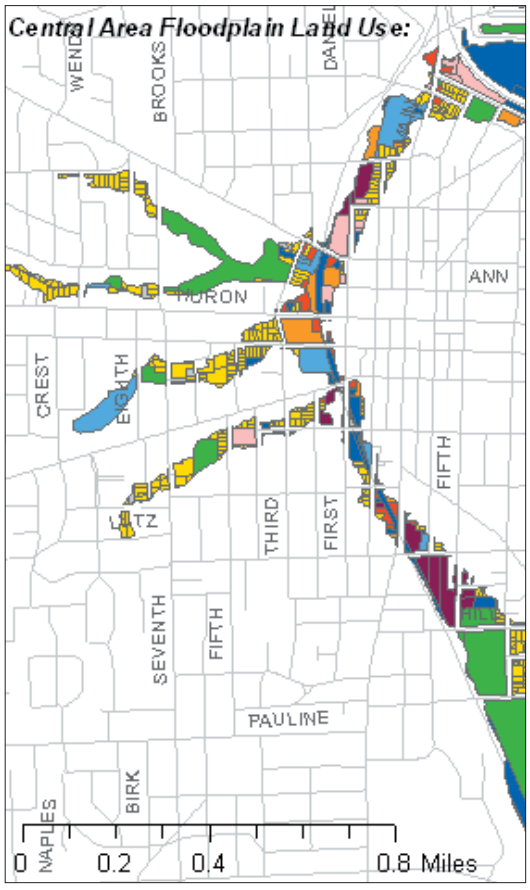
- Michigan Natural Resources Trust Fund
- National Park Service Land and Water Conservation Fund
- National Park Service Rivers, Trails and Conservation Assistance Program ("Rivers & Trails")
- Pre-Disaster Mitigation Grant Program
- Flood Mitigation Assistance Program
- Transportation Enhancement Program
- Congestion Mitigation and Air Quality Improvement Program
- Michigan Department of Environmental Quality (MDEQ) Coastal Management Program
- MDEQ Non-point Source Program
- MDEQ Brownfield Redevelopment Assistance
- Private Foundation Grants

Requirements and funding amounts for these sources can be found in the Appendix.

Resources for Greenway Maintenance

Once developed, ongoing maintenance of the Greenway and its open spaces is appropriately funded by:

- that portion of the new six-year Park Maintenance and Capital Improvements Millage dedicated to park maintenance and repairs. This 1.10 mill is expected to raise $4,866,585 in revenue in its first year (FY 2007-2008) and between 60% and 80% of the total millage revenue is to be used for maintenance and repairs over the entire park system.
- that portion of the General Fund allocated yearly to the parks and recreation system. The funding distribution guidelines for the new Park millage specify that maintenance and repairs of pathways, trails, boardwalks and greenways is to be covered by both the General Fund and the millage, and snow and ice control maintenance is to be funded exclusively by the General Fund.
- a "business improvement district" (BID) comprised of private land owners and business corporations formed as an association whose purpose is to maintain the Greenway open space. Typically, BID associations maintain foreground spaces immediately adjacent to their member properties and interests.



In addition to existing City resources, the Adopt-A-Park model should be promoted to engage private citizens and community groups to monitor and maintain discrete portions of the Greenway and its parks.

Conclusions

To recap, the following seven items are the more major decision points for resolution by Council and the community.

1. **Mixed-use of the flood fringe** on 415 W. Washington and 721 N. Main involves discussion of floodplain policy, and the results could have impacts well beyond use of the City's three sites in the Allen Creek valley.
2. **Floodplain policy** and the decision to prohibit or permit future work on new or existing buildings in the floodplain, i.e., to meet or go beyond current local, State and Federal statutes, is but one needed action; the other is realization that the existence of a floodplain hazard is a symptom of upstream conditions, and that the effort work to minimize

flooding and mitigate related hazards also includes implementing solutions to **watershed–wide problems**.

3. The Greenway, to be successful, **requires a commitment** of both the community's human and dollar resources, and determining the method to insure commitment over time.
4. **The University** is an important partner in the Greenway's long term vision, specifically in linking paths to the Stadium Boulevard bridge over AARR track and alternate off-road routing within The University's Athletic Campus.
5. **MDOT and the AARR** must be approached and encouraged to support the Greenway in concept and in place, by sharing its right-of-way for use as a rail-with-trail.
6. Discussions with **Norfolk Southern Rail Road** must also continue so that the Ann Arbor community south of the river can cross its tracks at logical and intuitive locations as a necessary part of the solution to stop currently illegal crossings.
7. The Allen Creek Greenway's **becoming a reality** involves both the leap of faith to deliberately do something now as recognition of the fact that a first step is the beginning of a much longer term implementation process.

To conclude, the Greenway as an urban gathering space, a place of refuge, a green retreat, and a cultural and civic destination is a desirable achievement for these City-owned sites. The floodway portions can begin to be transformed in a short period into the initial phase of a Greenway with landscaping, seating areas and activity spaces. The residents, downtown workers and visitors can begin to use and appreciate the amenities of the Greenway soon after the City vacates the two garage sites.

City Council can decide the direction of the floodway portions of the Greenway within the next six months so that initial implementation can begin once the sites are available. The community is clearly eager to participate in the planning process as Council addresses decision about the use of flood fringe and upland portions of the City's parcels. Both the nearby residential neighborhoods and retail/office associations would welcome the opportunity to assist in the design of this Greenway as a focal point.

Consideration of the floodway portions of the sites is the first step in a much larger community planning effort. As new information about site conditions becomes available, as policy decisions are made, and as other sites become available, next

steps leading to confirming and implementing the longer term vision can be taken.

Funding is a critical component in planning the development of these sites as the Greenway. The initial development may be modest, based on available funding. In addition to existing park funds, there are many opportunities for grants; potential sources were discussed earlier in the report.

Lastly, we conclude the tenure of the Task Force by expressing our appreciation for the opportunity to have examined the many facets of the vision for a Greenway along one edge of downtown Ann Arbor leading to the Huron River. ACGTF members have striven to fully understand the implications of the data we had before us and to consider with great care the different points of view within our group and the wider community. We fully support the idea and the reality of an Allen Creek Greenway and look forward to its evolution with time.

Draft: September 17, 2006

Public Participation in the Work of the Allen Creek Greenway Task Force

Since the late 1970s, people in Ann Arbor have talked about the potential for a greenway adjacent to the downtown area, within the Allen Creek floodplain. In an effort to explore this idea, the Ann Arbor City Council created the Allen Creek Greenway Task Force in August 2005.

Part of the Task Force's charge was to consult with the public during its planning stages. Effective public participation on any issue, especially one which is in its planning stages and that includes many technical and abstract elements, requires a certain amount of public education. This was approached through many different methods to reach the broadest audience possible. These include: exhibits, with continually updated information, displayed throughout the length of the process in several public locations; an information repository held in the main public library; public lectures discussing the concept of urban greenways held early in the process; Task Force business meetings and public workshops made open to the public and televised on CTN with repeated broadcasts shown through out the week; and a website containing a plethora of back-ground information, public meeting summaries, meeting minutes and current work products was maintained throughout the Task Force effort and can be found at http://www.a2gov.org/greenway/.

The hallmark of the public participation process was three public workshops held on April 22, April 29 and August 2, 2006. Over the course of the three events, more than 130 citizens came out to express their diverse opinions. Each workshop had two main parts – first, an educational presentation concerning the work of the Task Force and the Greenway and second, public participation based on the information presented using different methods of public engagement to collect information.

The first public workshop was designed to engage the public in a discussion of the "Big Picture" of the Allen Creek Greenway. Several questions were posed to attendees covering different aspects of a greenway, such as personal vision, connections between other parks and path-ways, role of the greenway in transportation, and architecture on the three main city-owned sites. Lively discussion in small groups was facilitated by a moderator and recorded. A summary of the discussions, showing the diversity of public views about the Greenway is provided in the Appendix.

The second public workshop focused specifically on the three city-owned sites to be included in the Allen Creek Greenway. The Task Force developed three visions for each site that provided a vision of an "Open Space Emphasis," "Blended Space Emphasis" and an "Architectural Emphasis" to reflect the amount of architecture that could be included in the three sites. Comments based on the pros and cons of each vision were recorded. The summary of public comment is provided in the Appendix.

The final public workshop, held near the end of the Task Force's work, presented information about the work of the Task Force to that date and how they had incorporated what they heard and what they learned from the public from the first two workshops. New visions for the three city-owned sites were presented and public testimony was taken from the public. A summary of each public comment is provided in the Appendix.

Citizens who could otherwise not attend a public meeting were provided information to respond to on the Internet. Workbooks of information and methods, times and alternative ways to participate were also provided to all workshop attendees and available for downloading from the Internet. Citizens were also given the option of responding and providing comment through mail, fax and e-mail.

Selected Grant Sources

Selected Grants for Acquisition of Land and Easements

Michigan Natural Resources Trust Fund

This State program provides matching grants for local outdoor recreation needs including land acquisition. Acquisitions that create or improve natural resource-based outdoor recreation opportunities and protect natural resources are favored. Improvements to Huron River water quality and the addition of recreational opportunities afforded by the greenway could make the project competitive.

- Approximately $20-$25 million is available each year
- No maximum for acquisition projects
- Requires at least a 25% local match

National Park Service Land and Water Conservation Fund

The State Side Grant Program provides matching grants to local governments for the acquisition, as well as the development and planning of public outdoor recreation areas and facilities. 75% of the total funds have gone to locally sponsored projects to provide close-to-home recreation opportunities that are readily accessible to youth, adults, and senior citizens.

- FY 2003: $94,383,000 was available to States and Michigan received $2,769,402
- Minimum award: $25,000; Maximum: $500,000
- 50% local match required
- Availability of funds for acquisition varies by year; no acquisition projects were funded in 2005.

Pre-Disaster Mitigation Grant Program

Once the City finalizes its Flood Hazard Mitigation Plan as a component of its Multi-Hazard Mitigation Plan, Ann Arbor will be eligible to compete for federal funds from this program, which includes grants for the acquisition of land for open space that will reduce overall risks to the population and structures.

- Minimum total award for state is $500,000; Maximum award for state is $15,000,000 for 2007. All states will receive no less than $500,000 providing that the state submits grants totaling at least that amount.

Selected Grants for Park and Trail Development

Michigan Natural Resources Trust Fund

In addition to grants for land acquisition (see above), this is a source of matching grants for the development of outdoor recreation facilities and amenities that protect natural resources.

- Maximum for development projects is $500,000
- Requires at least a 25% local match
- For development projects, applicant must control entire site

National Park Service Land and Water Conservation Fund

In addition to funding land acquisition (see above), the State Side section of this grant program provides grants for the development and planning of public outdoor recreation areas and facilities, favoring projects that provide close-to-home recreation opportunities accessible to youth, adults, and senior citizens.

- FY 2003: $94,383,000 was available to States and Michigan received $2,769,402
- 50% local match required

National Park Service Rivers, Trails and Conservation Assistance Program ("Rivers & Trails")
Provides in-kind assistance to locally led efforts to conserve rivers, preserve open space, and develop trails and greenways.

- Provides dedicated professional staff to assist with project planning, management and coordination, identification of funding sources, and facilitation and consensus building.
- Project assistance typically one to three years during a project's infancy.

Pre-Disaster Mitigation Grant Program
In addition to funds for the acquisition of flood-prone properties (see above), this FEMA program provides grants for mitigation projects that could include demolition, creation of ponds, bioswales, water features, etc.

- Minimum total award for state is $500,000; Maximum award for state is $15,000,000 for 2007. All states will receive no less than $500,000 providing that the state submits grants totaling at least that amount

Flood Mitigation Assistance Program
Another FEMA program that provides grants to implement measures that reduce or eliminate the long-term risk of flood damage to structures insurable under the National Flood Insurance Program.

Transportation Enhancement Program
The Transportation Equity Act for the 21st Century Federal (TEA-21) sets aside 10% from the State's Dept. of Transportation allocation for this program administered by the Michigan Department of Transportation to fund projects that promote non-motorized transportation, support community redevelopment, recognize the diversity of potential users, and ensure accessibility and the safety and security of non-motorized users.

- Michigan funded $20,468,400 in 2006
- 20% minimum match

Congestion Mitigation and Air Quality Improvement Program
Another TEA-21-funded program. Projects must produce a demonstrable, cost-effective reduction in vehicle emissions.

- Michigan distributes funds based on population, with about 2/3 of state funding going to SE Michigan.
- SEMCOG region splits funding 50/50 between transit and other eligible projects.
- Funds pedestrian and bicycle projects providing alternative commuting choices such as non-motorized facilities linking people to work, shopping, or other necessities.
- Requires 20% match

Michigan Department of Environmental Quality (MDEQ) Coastal Management Program
A federal coastal program administered by NOAA in partnership with local states. Michigan's program includes the entire state shoreline along the Great lakes and connecting waters. Planning projects do not have to be located within the coastal boundary but must have a direct benefit to coastal resources by providing storm water protection or cleaning up contaminated properties that affect water property.

- Approximately 40 projects funded each year
- Maximum up to $50,000
- Most types require a 50% match; State funds may be used as match (e.g. MNRTF)

MDEQ Non-point Source Program
Awards planning and implementation grants through the State's Clean Michigan Initiative and the federal Clean Water Act.

- For planning and implementation of projects on a watershed basis that prevent, eliminate, or reduce polluted runoff and/or erosion.
- Planning grants requires 10% local match
- Implementation grants require 25% local match

MDEQ Brownfield Redevelopment Assistance
Provides grants and loans to help redevelop Brownfield sites with priority given to projects that incorporate other state initiatives such as green building and greenway concepts, walkable city concepts, non-point source controls, cool city neighborhoods, and traditional downtowns.

- Loan rates are 2%, with no payments the first five years of the 15 year term.
- Applicant can be a local unit of government or a brownfield redevelopment authority
- Must demonstrate financial need and local contribution.
- Redevelopment must be identified or likely

Private Foundation Grants
Available from a variety of local and national foundations. In cases where the award amounts are too small to justify time and effort by City staff, non-profit organizations and citizen's groups may apply for small grants to fund discrete elements of the greenway and/or its parks.

Floodplain and Floodway Information

Background

The Federal Emergency Management Agency (FEMA) created flood maps called Flood Insurance Ratio Maps (FIRMs). These maps generally used topographic information from United States Geological Survey (USGS) maps. USGS maps use a very large scale and are not very precise (10-foot contour intervals). They show the general location of floodways and floodplains. City must use them in order for the City and its residents to be eligible for National Flood Insurance Program (to get flood insurance for homes and businesses in floodplains and floodways). Proposed development projects must FIELD VERIFY [emphasis in original notes] flood elevations since FEMA maps are not precise.

Rule: Can't build new residential in floodway; prohibited by the State. Can build residential in floodplain, as long as the lowest floor elevation is at least 1 foot above the elevation of a 100-year flood and an MDEQ permit is issued. Must show no net loss of flood storage capacity (e.g. new buildings should allow floodwaters to flow under them), AND no increase of flood stage at property line (e.g. can't increase flooding on neighbor's property).

Rule: Can build non-residential in floodplain and floodway as long as an MDEQ permit is obtained and the structure is elevated or flood-proofed to an elevation 1 foot above the 100-year flood.

Rehab Rule: Renovation of a building in the floodplain/floodway cannot exceed 50% of the value of the structure; residential rehabs must elevate the entire structure to 1 foot above the 100 year flood elevation; non-residential can choose to either elevate the structure 1 foot above the 100 year flood level or flood proof. If a petitioner does not propose to add to the building footprint or add more than 50% of value, no flood requirement exists.

Historic Preservation Rule: Modifications to historic properties that do not increase the building footprint are exempt from floodplain requirements in the state building code.

Provided by Jerry Hancock on March 15, 2005. A study is underway to obtain more precise mapping of floodway and floodplain boundaries.

Current Floodplain Regulations

Pertaining to the three city-owned sites in the Allen Creek floodplain

General Criteria

Construction projects within the Allen Creek Drain easement require a permit from the Washtenaw County Drain Commissioner

Construction projects within the floodplain require a permit from the Michigan Department of Environmental Quality (MDEQ). Flood flow may not be obstructed in a manner that causes a rise in flood elevations at the property line.

State, County, and City all require no net loss of flood storage capacity; i.e. no fill without compensatory dredging.

Floodway Requirements

State law prohibits new or expanded residential uses.

The lowest floor of any new non-residential structure must be elevated or flood-proofed to an elevation 1 foot above the 100-year flood elevation.

Flood Fringe Requirement

In the area of the floodplain outside the floodway, the lowest floor of any new residential structure must be elevated to an elevation 1 foot above the 100-year flood elevation.

The lowest floor of any new non-residential structure must be elevated or flood-proofed to an elevation 1 foot above the 100-year flood elevation.

Other Considerations

Flood Mitigation Plan – The City received a 75/25 grant from the Michigan State Police (MSP) Emergency Management to develop a Flood Mitigation Plan. The purpose of the plan is to develop strategies to reduce flood losses, minimize damage to public and private property and protect public health and safety. The grant ends in September 2005 unless an extension is requested. Public input is being sought to assist in selecting mitigation strategies. City Staff will be working directly with City Planning Commission and City Council to develop the final plan recommendations. The final recommended plan will be submitted to City Council and the MSP for consideration.

Map Modernization - All of the floodplains in Washtenaw County are in the process of being converted to digital format by the Federal Emergency Management Agency (FEMA). The Michigan Department of Environmental Quality is a Cooperating Technical Partner in that process and has funded a restudy of the Main branch and the West Park-Miller branch of Allen Creek. The consultants are currently in the process of surveying and data analysis. While we currently do not know if the flood elevations and boundaries will be moving up or down, by small or great amounts, we do know they will change. The first draft maps should be available late fall 2005 for review. It is anticipated that revised FEMA maps will be presented to City Council for adoption to become official in late 2006.

Observations

At this point in the Map Modernization/revision process, we know that floodplain boundaries, floodway boundaries, and base flood elevations are all likely to change. For example, a residential building approved at site plan stage adjacent to the floodway, could be in the floodway after the maps are revised and thus not be permitted by the MDEQ. It is advisable that decisions made about specific sites take into consideration the likelihood that floodplain boundaries, floodway boundaries, and base flood elevations will be subject to change during the Map Modernization project.

Prepared by Jerry Hancock, Certified Floodplain Manager
Land Development Coordinator, Systems Planning Unit, Public Services Area June 2005

Water Quality Sizing Information for the Allen Creek Greenway Task Force

Surface flooding begins along Allen creek at approximately a 1.5-year storm event. The 1.5-year storm event is equal to the bankfull storm event in Washtenaw County, or approximately 2.3 inches of rain in a 24 hour period. Storing volumes of water beyond the bankfull event could interfere with flooding patterns. Controlling the bankfull storm event for the runoff from each site would provide water quality benefits without significantly exacerbating flooding. Since each of the three City owned sites receives direct surface runoff from adjacent properties controlling two (2) times the bankfull event will also be estimated.

Assumptions for evaluation
Floodway area developed into green space (C=0.30).
Flood fringe developed with 70% impervious area (C=0.75)
Water quality improvements are more effective in shallow water systems. 1.5 foot maximum depth assumed as the average depth of basins for this exercise.

First and William
Size of site = 1.00 acre
89% floodway
Full site runoff coefficient C=0.35

Volume required to control First Flush storm on-site = 635 cubic feet
- At 1.5 feet of depth this would take a 21 x 21 foot area

Volume required to control Bankfull storm on-site = 2,860 cubic feet
- At 1.5 feet of depth this would take a 44 x 44 foot area

2 X Bankfull = 5,720 cubic feet
- At 1.5 feet of depth this would take a 62 x 62 foot area

Comments: Given that the site is only 125 feet wide at the widest point, it may be difficult to fit in a surface treatment BMP facility much larger than the size necessary to treat the first flush without significantly reducing other potential uses. Also since there is known soil contamination, water quality improvements might be better accomplished through the use of water quality catch basins, such as Stormceptor, or catch basin filter systems. Stormceptor Catch Basin units cost approximately $6,000.00 plus installation. Two or three of these units could improve water quality from the storm water generated from this sites in events smaller that the bankfull event.

415 W. Washington
Size of site = 2.50 acre
32.4% floodway
Full site runoff coefficient C=0.60

Volume required to control First Flush storm on-site = 2,723 cubic feet
- At 1.5 feet of depth this would take a 43 x 43 foot area

Volume required to control Bankfull storm on-site = 12,255 cubic feet
- At 1.5 feet of depth this would take a 90 x 90 foot area

2 X Bankfull = 24,510 cubic feet
- At 1.5 feet of depth this would take a 128 x 128 foot area

Comments: Fitting in a shallow basin with native plant material, sized to control the bankfull storm event from the site, appears to be the most logical size facility that could be accommodated on the east side of the site. Anything larger than that would be difficult to fit in due to the size of the site and utility constraints.

721 N. Main St.
Size of site = 5.20 acre
47.1% floodway
Full site runoff coefficient C=0.54

Volume required to control First Flush storm on-site = 5,097 cubic feet

- At 1 foot of depth this would take a 58 x 58 foot area

Volume required to control Bankfull storm on-site = 22,941 cubic feet

- At 1.5 feet of depth this would take a 124 x 124 foot area

2 X Bankfull = 45,882 cubic feet

- At 1.5 feet of depth this would take a 175 x 175 foot area

Comments: There is adequate space on this site to accommodate the largest facility listed above and maybe larger. Treating the bankfull storm event for the site and the adjacent properties could be accomplished. Treating larger events could exacerbate flooding in the area.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-05) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal CERCLIS list

CERCLIS: The Comprehensive Environmental Response, Compensation and Liability Information System contains data on potentially hazardous waste sites that have been reported to the USEPA by states,

municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

A review of the CERCLIS list, as provided by EDR, and dated 11/02/2012 has revealed that there is 1 CERCLIS site within approximately 0.5 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
ARMEN CLEANERS	603 S. ASHLEY STREET	SSE 1/4 - 1/2 (0.383 mi.)	O61	108

Federal CERCLIS NFRAP site List

CERC-NFRAP: Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

A review of the CERC-NFRAP list, as provided by EDR, and dated 11/02/2012 has revealed that there is 1 CERC-NFRAP site within approximately 0.5 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
ARMEN'S CLEANERS	***630 S ASHLEY***	***SSE 1/4 - 1/2 (0.406 mi.)***	***O66***	***116***

Federal RCRA generators list

RCRA-CESQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-CESQG list, as provided by EDR, and dated 09/11/2012 has revealed that there are 8 RCRA-CESQG sites within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

State- and tribal - equivalent CERCLIS

SHWS: The State Hazardous Waste Sites records are the states' equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. The data come from the Department of Environmental Quality's' Contaminated Sites List on Diskette With Address.

A review of the SHWS list, as provided by EDR, and dated 10/31/2012 has revealed that there are 9 SHWS sites within approximately 1 mile of the target property.

State and tribal leaking storage tank lists

LUST: The Leaking Underground Storage Tank Incident Reports contain an inventory of reported leaking underground storage tank incidents. The data come from the Department of Environmental Quality's Leaking Underground Storage Tank (LUST) Database.

A review of the LUST list, as provided by EDR, and dated 11/05/2012 has revealed that there are 25 LUST sites within approximately 0.5 miles of the target property.

EXECUTIVE SUMMARY

State and tribal registered storage tank lists

UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the Department of Environmental Quality's Michigan UST database.

A review of the UST list, as provided by EDR, and dated 11/05/2012 has revealed that there are 10 UST sites within approximately 0.25 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 09/11/2012 has revealed that there are 10 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

A review of the EDR MGP list, as provided by EDR, has revealed that there are 2 EDR MGP sites within approximately 1 mile of the target property.

Environmental Interest/Information System

US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

Hazardous Waste Summary:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Environmental Interest/Information System

GT PRODUCTS INC (Continued) **1000128636**

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Site Description: Michigan Department of Environmental Quality (MDEQ) asked for assistance in performing a Site Assessment and possible Time Critical Removal. The site is an active commercial laundry facility that uses Tetracholoroethylene. MDEQ has conducted emergency response actions to mitigate indoor levels of PERC that are evaporating out of the groundwater beneath several houses.

Classification: Small Quantity Generator

Hazardous Waste Summary:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE

ARMEN'S CLEANERS (Continued) **1000206972**

MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Violation Status: No violations found

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

CERCLIS (Comprehensive Environmental Response, Compensation, and Liability Information System) is the Superfund database that is used to support management in all phases of the Superfund program. The system contains information on all aspects of hazardous waste sites, including an inventory of sites, planned and actual site activities, and financial information.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 10/01/2012
Date Data Arrived at EDR: 10/11/2012
Date Made Active in Reports: 12/20/2012
Number of Days to Update: 70

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 10/01/2012

Next Scheduled EDR Contact: 04/22/2013
Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Federal Delisted NPL site list

DELISTED NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 10/01/2012
Date Data Arrived at EDR: 10/11/2012

Next Scheduled EDR Contact: 04/22/2013
Data Release Frequency: Quarterly

Federal CERCLIS list

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 11/02/2012
Date Data Arrived at EDR: 11/28/2012

Data Release Frequency: Varies

Federal CERCLIS NFRAP site List

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Date of Government Version: 09/11/2012

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

RCRA-SQG: RCRA - Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

RCRA-CESQG: RCRA - Conditionally Exempt Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

State- and tribal - equivalent CERCLIS

SHWS: Contaminated Sites

State Hazardous Waste Sites. State hazardous waste site records are the states' equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. Available information varies by state.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

Other Ascertainable Records

RCRA NonGen / NLR: RCRA - Non Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006

Data Release Frequency: Quarterly

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

Data Release Frequency: No Update Planned

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Oil/Gas Pipelines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

Electric Power Transmission Line Data
Source: Rextag Strategies Corp.
Telephone: (281) 769-2247
U.S. Electric Transmission and Power Plants Systems Digital GIS Data

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on private school locations in the United States.

Daycare Centers: Day Care Centers, Group & Family Homes
Source: Bureau of REgulatory Services
Telephone: 517-373-8300

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 2003 & 2011 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 and 2005 from the U.S. Fish and Wildlife Service.

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principal investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

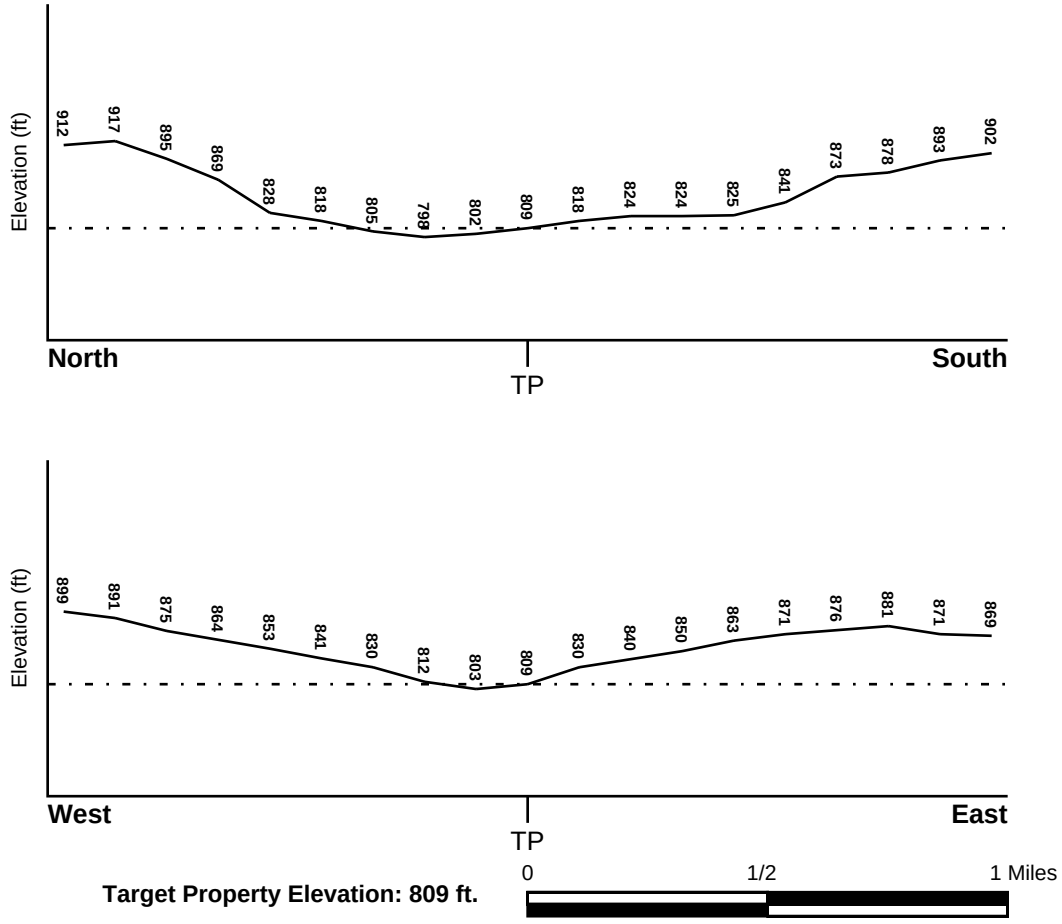
TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General NW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES



Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Target Property County	FEMA Flood Electronic Data
WASHTENAW, MI	Not Available

Flood Plain Panel at Target Property: Not Reported

Additional Panels in search area: Not Reported

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
ANN ARBOR WEST	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
A1	0 - 1/8 Mile NNE	NNW

3	1/4 - 1/2 Mile SE	ENE
7	1/2 - 1 Mile NE	ENE
9	1/2 - 1 Mile NNE	Not Reported
10	1/2 - 1 Mile SE	NNW

For additional site information, refer to Physical Setting Source Map Findings.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

Era:	Paleozoic

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name:	BOYER
Soil Surface Texture:	sandy loam
Hydrologic Group:	Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.
Soil Drainage Class:	Well drained. Soils have intermediate water holding capacity. Depth to water table is more than 6 feet.

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel: LOW

Depth to Bedrock Min: > 60 inches

Depth to Bedrock Max: > 60 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification			
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	Permeability Rate (in/hr)	Soil Reaction (pH)
1	0 inches	7 inches	sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 6.00 Min: 2.00	Max: 7.30 Min: 5.60
2	7 inches	18 inches	loamy sand	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 6.00 Min: 2.00	Max: 7.30 Min: 5.60
3	18 inches	34 inches	sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand.	Max: 6.00 Min: 2.00	Max: 7.80 Min: 5.60
4	34 inches	60 inches	gravelly - sand	Granular materials (35 pct. or less passing No. 200), Stone Fragments, Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Clean Sands, Poorly graded sand.	Max: 20.00 Min: 20.00	Max: 8.40 Min: 7.40

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures: loamy sand
muck
loam

Surficial Soil Types: loamy sand
muck
loam

Shallow Soil Types: silty clay loam
sandy loam
clay loam

Deeper Soil Types: sand
sand and gravel
stratified
clay loam
loam

coarse sand
muck

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Scanned Digital USGS 7.5' Topographic Map (DRG)
Source: United States Geologic Survey
A digital raster graphic (DRG) is a scanned image of a U.S. Geological Survey topographic map. The map images are made by scanning published paper maps on high-resolution scanners. The raster image is georeferenced and fit to the Universal Transverse Mercator (UTM) projection.

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 2003 & 2011 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 and 2005 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetlands Inventory

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Services, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

STATE RECORDS

Water Well Data
Source: Department of Environmental Quality
Telephone: 517-335-9218
The data in this file was obtained from Wellogic, the Michigan Department of Environmental Quality Statewide Groundwater Database (SGWD). Wellogic contains approximately 425,000 water well records found within the State of Michigan, and although it represents the best available data, it cannot be considered a complete database of all the wells or well records in existence.

OTHER STATE DATABASE INFORMATION

Michigan Oil and Gas Wells
Source: Department of Environmental Quality
Locations of oil and gas wells are compiled from permit records on file at the Geological Survey Division (GSD), Michigan Department of Natural Resources.

APPENDIX L

QUALIFICATIONS OF ENVIRONMENTAL PROFESSIONAL

TETRA TECH

Patti J. McCall
Senior Geologist

Senior Geologist with work experience as senior project manager, project geologist, and senior scientist. As a Senior Geologist, Ms. McCall has managed site characterization, remediation, hydrogeological, wetland and landfill projects, and ecological risk assessments, regulatory compliance investigations, Michigan Department of Environmental Quality (MDEQ) Part 201 and 213 investigations, Phase I and Phase II environmental site assessments (ESAs), and proposal preparation.

Additional responsibilities include, but are not limited to; underground storage tank compliance activities; implementing landfill monitoring projects, groundwater sampling and methane monitoring, wetland delineations and mitigation monitoring, project budgeting and tracking. Ms. McCall has completed and certified USEPA Greenhouse gas reporting for municipal landfills and prepared remedial investigations, hydrogeological investigations, initial and final assessment reports, work plans, closure reports, remedial action plans, statistical analysis, wetland delineation reports, wetland mitigation monitoring reports and Joint Permit Application preparation. She has supervised ongoing remediation projects, Phase I and II ESA's, ground water monitoring, and report presentation.

EXPERIENCE

Key Landfill Experience

Municipal Waste Landfill, Ann Arbor, Michigan – Senior Geologist and Project Manager responsible for overseeing the completion of groundwater, wastewater and gas sampling events on a quarterly basis, methane collection system operations, database management and evaluation, wastewater discharge mass balance calculations, maintenance repairs and subcontractor coordination budget tracking and task management. Ms. McCall is also responsible for coordinating with and attending meetings when necessary with the MDEQ and attending monthly project meetings with City of Ann Arbor personnel.

Other activities completed during the contract period include a leachate outbreak investigation and landfill cap repair work plan preparation, installation and final report; an historical review and completion of a report to document proper closure of Phase I, assistance with and final preparation of the offsite remedial action plan, completion of the United States Environmental Protection Agency (USEPA) greenhouse gas mandatory reporting requirements, completion of the Industrial User Permit (IUP) renewal application, optimization of the north side methane collection system including the addition of a telemetry system, a bioremediation pilot test and a successful revision to the gas monitoring plan, significantly reducing the sampling plan requirements.

Education:

B.S., Geology, Indiana University Northwest, Gary, Indiana, 1999

B.S., Public Policy, Indiana University, Bloomington, Indiana, 1993

Professional Affiliations:

American Institute of Professional Geologists

Geological Society of America

Huron River Watershed Council

Michigan Association of Environmental Professionals

University of Michigan Matthaei Botanical Gardens and Nichols Arboretum

Sigma Xi

Registrations/ Certifications:

40-hour HAZWOPER, Compliance Solutions 2002 Southfield, Michigan with annual 8-hour refreshers from 2003 to present.

Adult First Aid, CPR and AED certified 2007 by American Red Cross with annual refreshers from 2008 to present.

FRA 214 Railroad Workplace Safety On-Track Safety Canadian National Railway 2011 to present

TransCanada Health, Safety and Environment Training 2012

Office:

Ann Arbor, Michigan

Years of Experience:

Eleven

Years with Tetra Tech

Six

As a senior scientist at a previous firm, Ms. McCall was responsible for completing field sampling activities, environmental reporting, completing a groundwater discharge investigation and coordinating the 1,4-dioxane onsite treatment pilot test.

Capture Zone Analysis at Municipal Landfill, Ann Arbor, Michigan – Project manager and geologist on a team of scientists and engineers, who successfully updated the site conceptual model and completed a capture zone analysis of the existing extraction well configuration. Activities included updating the geological interpretation, installing observation wells and completing an aquifer analysis and numerical groundwater model. The results provided a significant cost savings to the city of Ann Arbor by allowing one extraction well to be turned off. A modification to the IUP was completed and approved by the City of Ann Arbor to reduce the sampling requirements of the extraction well.

Previous firm

Private Type II Landfill, Birch Run, Michigan – Senior scientist responsible for overseeing the completion of groundwater, gas and primary and secondary leachate sampling events on a quarterly basis, database management and evaluation, secondary leachate discharge volume calculations, maintenance repairs and subcontractor coordination, annual MDEQ inspections, budgeting and task management and coordination with the MDEQ project manager, site supervisor and client.

Numerous Type II Landfills, Lower Michigan – Senior scientist responsible for statistical evaluations and tolerance limit calculations both site wide and intra well; assistance with completion of groundwater, gas and leachate sampling on a quarterly basis, database management and evaluation, budgeting and task management on numerous type II landfills.

Key Environmental Site Characterization, Remediation and Property Transfer Project Experience

Canadian National Railway, Detroit, Michigan – Senior Geologist responsible for reviewing FOIA documents and data from previous consultants, creating Areas of Concern, developing a sampling strategy and implementing a phased approach to delineating soil and groundwater impacts. Additional tasks include identifying current underground infrastructure as possible sources of LNAPL conveyance using ground penetrating radar (GPR) and electromagnetic locating equipment, completing a statistical background metals analysis, completing test pits, removing oil from site catch basins and attending regular meetings with the client for progress updates. A focused feasibility study is being prepared to provide remediation and closure plans for a variety of land use options.

721 N. Main Street, Ann Arbor, Michigan – Senior Geologist responsible for completing a Phase I ESA for the City of Ann Arbor's former Fleet Facility and Maintenance Garage. The completion of the Phase I required input from numerous City of Ann Arbor employees and coordination between SmithGroupJJR, Tetra Tech and City of Ann Arbor personnel.

Millers Creek Sediment Assessment, Ann Arbor, Michigan – Senior Geologist responsible for developing a sampling plan for characterizing the removal of approximately 1,000 cubic yards of sediment from a creek. A significant cost savings was realized by sampling the creek for all potentially necessary parameters to be placed on hold with the laboratory, while sieve analyses were completed. Results of the sieve analysis indicated a sufficient percentage of sand grains to preclude quality analysis of the sediment for contaminants. However one sample was

analyzed for select parameters to complete waste profiling, should City personnel chose to dispose of the sediment at a landfill.

Municipal Waste Landfill, Ann Arbor, Michigan – Senior Geologist responsible for overseeing the completion of a bioremediation pilot test on a vinyl chloride plume. Responsibilities included coordination with state, county and city officials for permits and concurrence on injection of an emulsified vegetable oil remediation product. The pilot test required the installation of seven injections wells and an observation well to approximately 20 feet. A manifold system was used to inject EOS from 55 gallon drums followed by a water flush using the city's hydrant. Additional sampling required by MDEQ included secondary metal releases and methane generation. Follow-up sampling to determine the success of the pilot test has demonstrated complete dechlorination of vinyl chloride to ethene and significant mass removal.

Automotive Manufacturing Facility, Confidential Client, Michigan – Senior Geologist responsible for planning and completing an investigation into leaking oil lines from presses at an active manufacturing facility. The investigation included vacuuming out a previously abandoned underground oil line and connecting sump locations, installing a mobile camera to determine the integrity of the pipe/sumps and presence of oil, pushing water through the line to determine which presses were connected to the previously abandoned pipeline system, finding connections and capping known locations, investigating the trench system of all presses and finally filling the abandoned line with flowable fill.

Automotive Manufacturing Facility, Confidential Client, Michigan – Senior Geologist responsible for planning and completing chemical oxidation injections as corrective action on a Resource Conservation and Recovery Act (RCRA) site to remediate heavy metals (chiefly hexavalent chromium and nickel) from the groundwater. The site is successfully being remediated through interim actions, removing the need to implement large-scale infrastructure that would be necessary for a pump and treat system, originally planned for the corrective measure. Completing chemical oxidation has created a cost savings for the client while attaining cleanup objectives in a shorter timeframe. Due to site and time constraints and the active nature of the facility, the work has required a great deal of coordination between parties and production schedules.

Automotive Manufacturing Facility, Confidential Client, Michigan – Senior Project Geologist responsible for completing closure activities for six RCRA Solid Waste Management Units (SWMUs) including the excavation of three former sludge settling lagoons and a process underground storage tank. Verification of soil remediation and groundwater samples were collected in accordance with *MDEQ Sampling Strategies and Statistics Training Materials for Part 201 Cleanup Criteria* and a closure report has been submitted for four of the six SWMU's.

The remaining two SWMUs include a wastewater treatment plant (WWTP) that formerly conveyed electroplating waste and an oil/water decanting farm located adjacent to the WWTP. Selective demolition was completed on the WWTP to remove all piping, chemical tanks and sumps, including electrical conduit related to the former process. Restoration activities included the addition of a concrete drive for tanker trucks and a garage door and driveway for facility access. A natural gas line was installed to bring heat to the WWTP from the powerhouse.

During the demolition, a drilling investigation was completed under the former oil/water decanting farm that identified hydraulic oil impacts in the soil. An excavation was completed to remove the soils above the thin native clay unit protecting the perched aquifer. A bioremediation product, Micro-Blaze^{R} was applied to the native clay to

enhance biological degradation of the oil. Site characterization was completed to delineate the extent of the impact under the existing containment area and WWTP. Passive recovery and monthly free product checks are being completed while remedial options are being investigated.

Automotive Manufacturing Facility, Confidential Client, Michigan – Senior Geologist responsible for completing closure activities for a RCRA SWMU that was a former construction debris landfill. Activities included excavation, wetland delineating and permitting, concrete roadway replacement, backfill and seeding and planting restoration activities. The landfill contained concentrations of trichloroethene and daughter products above applicable criteria that migrated from the capped landfill, down a slope and into a wetland that serves as the groundwater surface water interface compliance point. Excavation has occurred in three phases. The first phase required steel shoring to maintain structural integrity of a retaining wall and concrete roadway replacement in winter. The second phase required excavation along a slope to depths greater than 25 feet into clay. The third phase of excavation was within a wetland and required coordination with MDEQ state wetland regulators and submittal and approval of a JPA. Verification of soil remediation and groundwater samples were collected in accordance with *MDEQ Sampling Strategies and Statistics Training Materials for Part 201 Cleanup Criteria*. Wetland restoration included backfilling with primarily clay to maintain the perched nature of the wetland and grading to pre-excavation elevations. The area was planted with an emergent wetland seed mix and a dozen wetland shrubs were planted in the spring of 2012. An Interim Measures Implementation Report has been submitted to MDEQ.

Automotive Manufacturing Facility, Confidential Client, Michigan – Senior Project Geologist responsible for completing the excavation of PCB-containing sediment from an outfall discharge to a wetland. The project included delineating the wetland, completing and obtaining a permit from the MDEQ for excavation and dewatering activities within the wetland, engineering two new outfall structures with oil water separators, and restoring the wetland. Verification of soil remediation and groundwater samples were collected in accordance with *MDEQ Sampling Strategies and Statistics Training Materials for Part 201 Cleanup Criteria* and a closure report was submitted.

East Stadium Boulevard Bridge Project, Ann Arbor, Michigan – Senior Geologist responsible for designing and implementing a soil characterization sampling plan prior to replacement of the East Stadium Boulevard Bridge and associated and nearby utility infrastructure. Responsibilities included reviewing nearby facility data, developing a sampling plan for infrastructure routes along the boulevard and the six earthen walls surrounding the bridge, conducting a site meeting for private, city and University of Michigan utilities prior to subsurface work, implementing a hand auger and direct push drilling plan, completing a statistical analysis of soil concentrations above applicable criteria, and preparing a letter report of findings and recommendations. The age of the fill material used to build the earthen walls surrounding the bridge and the past industrial uses in the area required an extensive sampling plan. Additional area information and statistical analysis were used to reduce the sampling parameters and coordination with local landfill operations prior to sampling implementation helped to reduce the overall number of samples required. Other responsibilities included preparing a Due Care Plan, estimating dewatering volumes, completing groundwater sampling and assisting with groundwater to surface water discharge needs.

Various Projects, Ann Arbor, Michigan – Senior Geologist responsible for additional 'on-call' environmental projects as needed. During the contract period 2007 to 2012, the City of Ann Arbor personnel have required environmental assistance with a variety of projects including: sampling and removal of a found underground storage tank during utility installation; sampling and site characterization assistance during utility installation for

petroleum impacted groundwater; sampling and site characterization assistance during utility installation for suspected petroleum impacted soils; sampling and determining safety protocols for handling slag; sampling and completing a waste profile for railroad embankment soils; developing and implementing a soils sampling plan and coordinating with University of Michigan for impacts within the City-owned road right of way; sampling and site characterization assistance during water main replacement and road improvements for suspected petroleum impacted soils; soil sampling and site characterization for soil/debris pile removal during a water main installation project in an area park; and groundwater sampling and site characterization for an embankment improvement area near a railroad for suspected water contaminants.

During the contract period beginning in 2012, the City of Ann Arbor personnel have required environmental assistance with an additional number of projects including: sampling, field assistance with delineating impacts and completion of a waste profile for petroleum impacted soils encountered during utility installation; surface water sampling and completion of a waste profile for railroad embankment soils; and sampling and characterization assistance with leaf sampling to determine if street swept leaves could be used for composting.

Pall Life Sciences 1,4-dioxane plume, Ann Arbor, Michigan – Senior Project Geologist responsible for oversight, budget tracking and client coordination for a third party review completed by Doug Sutton, Principal Engineer of GeoTrans, Inc. (former name of Tetra Tech GEO). The site conceptual model completed for the Evergreen Area of the Pall Life Sciences (PLS) 1,4-dioxane contaminant plume by PLS's consultant Fishbeck, Thompson, Carr & Huber, Inc (ftc&h) and MACTEC Engineering and Consulting was reviewed by Mr. Sutton Ms. McCall and Mr. Sutton attended a meeting with PLS, ftc&h, MACTEC, City of Ann Arbor and Washtenaw County personnel to review ftc&h/MACTEC findings, Mr. Sutton's findings and provide recommendations for additional data needs moving forward. A summary letter of the meetings key findings was produced by Ms. McCall and Mr. Sutton for the City of Ann Arbor.

Previous firm

Sunoco Gas Station, Luna Pier, Michigan – Senior Scientist responsible for emergency response to a diesel fuel spill from a gas station to Lake Erie. The project required coordination with United States Coast Guard, USEPA Region V, numerous MDEQ divisions, City of Luna Pier officials and the gas station owner (client). Ms. McCall provided direction and completed oversight of field activities including investigation of the diesel fuel leak from pumps, through utilities to the wastewater treatment pump station and finally to Lake Erie. This included completing excavation, numerous infrastructure repairs and replacements; drilling activities to delineate free product; continuous vacuum pumping to maintain further releases offsite, jet-cleaning utilities to the Lake; installing a recovery trench and recovery wells and installing a mobile SVE system. Twice daily meetings were coordinated and lead by Ms. McCall to facilitate the cleanup with field personnel, subcontractors, USEPA's Superfund Technical Assessment & Response Team (START) contractor, regulatory personnel (state and federal) and City officials and wastewater treatment operators. When the client was unable to meet financial obligations, the USEPA exerted jurisdiction over the site and requested Ms. McCall's return to complete additional subsurface investigational work and data analysis.

Former Manufacturing Facility, Confidential Client, Michigan – Senior Scientist responsible for developing a sampling plan and implementing a Phase II site investigation for a former foam and plastic manufacturing facility that previously supported the automotive industry. The initial Phase II investigation included gathering soil and

groundwater data through temporary monitoring wells. Following the initial Phase II investigation and data evaluation, a second mobilization to delineate impacts was completed. The data was evaluated and recommendations were made for impacted areas. A BEA was completed to assist with the sale of the property and submitted to the MDEQ.

Retail Petroleum Market, Multiple Site Divestiture, Confidential Client, Southeast Michigan – Senior Scientist on a team responsible for completing a fast-track, real estate divestiture assessment of 26 locations in the metropolitan Detroit area. Each site assessment was completed within four weeks and all 26 sites were completed in a three month timeframe, requiring management of multiple sites per team member. Each site assessment included placement and installation of an average of six soil borings and groundwater monitoring wells, soil sample and groundwater collection, data evaluation and site divestment assessment reporting. Site work was completed in accordance with the client specific health and safety requirements, which required project personnel to attend two 8-hour training sessions. The client's compressed schedule and project goals were achieved and all work was completed without a health and safety incident.

Commercial Petroleum Multiple Phase I Environmental Site Assessments (ESAs), Confidential Client, Southeast Michigan – Senior Scientist on a team responsible for completing Phase I ESAs at 13 locations in the metropolitan Detroit area within a 30-day timeframe in accordance with the ASTM standard. In addition to specific site reporting tasks, Ms. McCall was responsible for completing a technical review of the 13 client-specific formatted Phase I ESA reports. Two levels of client review were completed prior to the report finalization. The client's compressed schedule and project goals were achieved.

Former Manufacturing Facility, Oceana County, Michigan – Senior Scientist responsible for completing a Phase II site investigation, BEA and Due Care Plan at a former manufacturing facility. The property was classified as a leaking underground storage tank (LUST) site, which was known by the client prior to purchase. A Category N BEA was completed on behalf of the purchaser to obtain liability protection for the existing contamination resulting from the LUST. A Due Care Plan was also developed and included with the BEA submittal.

Clawson Concrete (Edw. C. Levy Property), Detroit, Michigan – Senior Scientist responsible for planning and implementing scopes of work, coordinating with the client, and completing field activities including site and off-site characterization, notice of migration drafting, well installations, free product recovery, monthly free product checks; Part 213 semi-annual progress reports; excavation planning and implementation, Final Assessment Report update and site closure activities. The site was granted closure with no further action required by MDEQ.

Former Retail Gas Station, Romulus, Michigan – Senior Scientist responsible for completion of site characterization, soil and groundwater sampling, completion of a feasibility analysis of remedial options, and development and implementation of corrective actions including excavation oversight, dewatering activities and installation of an oxygen releasing compound (ORC) to complete bioremediation in the utility corridor where excavation was not feasible. A final report documenting site activities was submitted to the MDEQ. The project was completed for the State of Michigan through a Level-of-Effort (LOE) state contractor (MACTEC) project management program. A bid package was drafted and selection of trade contractors for the remedial activities was completed in accordance with MDEQ requirements for the LOE contract.

Automotive Supplier Manufacturing Facility, Confidential Client, Rochester, Michigan – Senior Scientist responsible for planning and implementing the closure-in-place of three unregulated underground storage tanks (USTs) located beneath the active facility's interior floor. Soil sampling was completed around the USTs in accordance with *MDEQ Sampling Strategies and Statistics Training Materials for Part 201 Cleanup Criteria* guidance. The facility maintained full production while the USTs were located, the concrete floor and steel tanks were accessed, the airspace inside the USTs were rendered inert and the USTs were cleaned before filling with concrete. To complete the project safely within the schedule and budget, continual coordination and communication was required with plant personnel as well as innovative and evolving planning and implementation to ensure the facility's production schedule was not impacted.

Part 213 Investigations, Numerous Clients Michigan - Completion of MDEQ Part 213 Leaking Underground Storage Tank Closure reports for sites with reported petroleum releases. Tasks completed included preparation of Interim Action Reports (IARs); supervision of UST removal activities; collection of verification of soil remediation samples; quarterly groundwater monitoring events and data evaluation, monthly free product events, system operation and maintenance, development of corrective action plans, preparation of MDEQ Part 213 Site Assessment, and preparation of Final Assessment Reports (FAR) for Tier I and II sites.

Phase I and II Environmental Site Assessments (ESA) - Numerous Clients, Michigan – Completion of Phase I and Phase II ESAs for residential, commercial and industrial clients within Southeast Michigan using ASTM standards and All Appropriate Inquiry (AAI) for site assessments. Additional scope of work for Phase I ESAs included wetland delineations where appropriate.

Key Wetland Experience

Municipal Project, Genoa Oceoloa Township, Michigan – Senior project geologist responsible for coordination and completion of formal wetland delineation and stream identification activities along 1.5+/- miles of a proposed sanitary sewer installation along Latson Road to connect two existing pump stations. The project was required to alleviate capacity issues along Grand River Avenue. In addition, Michigan Department of Transportation (MDOT) has a scheduled improvement project at the Latson Road interchange that would have required the relocation of the existing force main prior to the MDOT schedule. A JPA was submitted for the regulated wetland and stream crossings to meet the schedule.

Canadian National Railway, Michigan – Senior Geologist on a team of scientists responsible for providing a GIS platform of CN's railways through Michigan's natural resources. The database will provide end users the ability to determine potential locations that require permitting or where mitigation banks are available in various watersheds. Layers include National Wetland Inventory (NWI) Cowardin types, National Wild and Scenic Rivers, Soil Survey Geographic Database (SSURGO) maps; State of Michigan mapped wetlands, Watershed boundaries, topography, Wetland mitigation banks and the CN Railway throughout Michigan marked with mileposts. The current work is expected to expand to surrounding states where CN has rail lines.

TransCanada, Ottawa and Kent Counties, Michigan – Senior Geologist on a team of scientists and engineers assisting with a 16.5-mile corridor wetland delineation and construction activities for removal and abandonment of a natural gas pipeline in Kent and Ottawa Counties. The project included evaluating workspaces to minimize wetland impacts, coordinating with USACE and MDEQ for qualifying permit exemptions and facilitating both cultural and threatened and endangered species surveys to satisfy Federal Energy Regulatory Commission (FERC) requirements. A wetland delineation report was submitted to the MDEQ Wetland Identification Program and an onsite meeting was held with the MDEQ wetland regulator. A pre-application meeting was held onsite to review changes in the project scope and determine the necessity of a JPA for stream impacts. The activities were exempt from the wetland permitting process.

Energy Sector, Confidential Client, Michigan – Senior geologist working with a team of scientists and engineers, responsible for assisting in alternative analysis and new construction building envelope options resulting in the least amount of wetland disturbance in conjunction with logistical, economic, environmental and project goals. Additional responsibilities included assistance with watershed analysis, planning and drafting a conceptual mitigation document, meetings with regulatory agencies, producing a Request for Additional Information document to the Combined Operating Licensing Application for submittal to the United States Army Corps of Engineers (USACE) and completing a Joint Permit Application for MDEQ and USACE submittal. The JPA was approved by MDEQ in January 2012.

In accordance with the JPA process and to receive approval for a draft permit, mitigation was required for wetland impacts. An offsite parcel was necessary to achieve the mitigation acreage. After locating a suitable parcel, Ms. McCall was responsible for overseeing completion of a wetland delineation on a 210-acre agricultural field and regulatory concurrence using the state's Wetland Identification Program that included an onsite review by representatives from the MDEQ and USACE. Additional responsibilities included completion of geotechnical borings, direct push drilling and installation of piezometers, transducer installation, 12 weeks of water level gauging, stream gauging and transducer data download. Data was evaluated and a report of findings was completed for use in determining the site's water budget for mitigation planning.

Automotive Manufacturing Facility, Confidential Client, Michigan – Senior project geologist responsible for coordination and completion of a formal wetland delineation and oversight and assistance of an approved screening level ecological risk assessment (SLERA) on the undeveloped portion of a 180-acre industrial property. Activities for the SLERA included sediment sampling with a mini-ponar, soil and surface water collection, database management, statistical analysis, reporting and coordination with both the state of Michigan and the USEPA Region V. A modified Baseline ERA Sampling Plan was submitted and approved by the state of Michigan. Soil and specimens were collected and tissue sampling and analysis were completed. A bioaccumulation study, statistical analysis and final modified BERA were submitted and approved by USEPA and the MDEQ.

Municipal Project, Genesee County, Michigan – Senior project geologist responsible for coordination and completion of formal wetland delineation and stream identification activities along 5.5+/- miles of a proposed sanitary sewer alignment and completion of a Phase I ESA along the proposed corridor. Responsibilities also include alignment location and construction method recommendations for the project engineer in order to eliminate or minimize potential wetland or stream impacts; coordination with the state regulatory authority, attendance at a pre-application meeting with the state wetland regulator and completion of a JPA for the regulated wetland impacts. A permit was granted by MDEQ in April 2012.

Golf Course Redevelopment, Ottawa Lake, Michigan – Senior project geologist responsible for completion of a wetland delineation and regulatory assessment within the state of Michigan's Wetland Protection Law. Four ponds on the property were proposed for either expansion or fill and a wetland connected to a county drain were identified. Attendance at an onsite pre-application meeting with MDEQ personnel and changes in development planning resulted in a letter report to the state in lieu of a Joint Permit Application providing the client significant cost and time savings.

Various Municipal and Commercial Projects, Southeast Michigan and Northwest Ohio – Senior project geologist responsible for coordination and completion of formal wetland delineations and assessment activities prior to construction activities. These delineations and assessments were necessary for determining building envelopes, construction and planning activities and regulatory requirements for both municipal and commercial developments ranging from bridge improvement and utility infrastructure improvements to golf course improvements.

Previous firm

Various Residential and Commercial Developments, Southeast Michigan – Senior scientist responsible for coordination and completion of formal wetland delineations throughout Livingston, Wayne, Ingham, Genesee, Oakland and St. Clair Counties in southeast Michigan. These delineations were required for both residential and commercial developments with properties ranging in size from less than an acre to greater than 100-acres. The majority of these delineations were reviewed and approved by the MDEQ as accurate.

Municipal Project, Sanilac County, Michigan – Senior scientist responsible for coordination and completion of formal wetland delineation and stream identification activities along 26+/- miles of a proposed water main alignment. Responsibilities also included alignment location and construction method recommendations for the project engineer in order to eliminate or minimize all potential wetland or stream impacts. The project was completed in two months; impacts were minimized to meet the MDEQ's general permit requirements and resulted in receipt of a permit within 30 days of submittal. The project fast-track was required to meet significant funding timelines.

Residential/Commercial Traditional Neighborhood Development, Howell and Fowlerville, Michigan – Senior scientist responsible for coordinating and completing annual wetland mitigation monitoring activities. Wetland mitigation included the creation of 1.41-acres of emergent wetland in addition to riffle and pool and meander stream construction along 800-feet of county drain. Monitoring activities included sampling along seven transects; data collection within 38 sample plots along the established transect lines; data analysis using the Floristic Quality Assessment; and statistical analysis to determine plant dominance, degree of wetness and diversity.

Lake Dredge, Brooklyn, Michigan – Senior scientist responsible for coordination with and attendance at an MDEQ pre-application meeting to determine application needs and the MDEQ's concerns related to proposed lake dredging required for adequate boat access. Prior to the application process, access to open water of the lakefront property was dominated by aquatic bed wetland at shallow depths. Dredging of the aquatic bed was proposed. Responsibilities in addition to the MDEQ coordination, included preparation of an MDEQ permit application detailing the project needs, alternatives analysis and design parameters.

Residential Development, Fenton Township, Michigan – Senior scientist responsible for coordinating and completing annual wetland mitigation monitoring activities. Wetland mitigation included the creation of 1.33-acres of emergent wetland at four separate locations within the development. Monitoring activities include qualitative sampling and data analysis using the Floristic Quality Assessment; and statistical analysis to determine plant dominance, degree of wetness and diversity within the four mitigation areas.

Residential Development, Burtchville Township, Michigan – Senior scientist responsible for completion of a formal wetland delineation required for resolution with the MDEQ and future sale of lots for residential development. Project specifics included delineation of a unique forested wetland system located on former lake beach and ridge land formations. The area was determined to represent a unique natural resource requiring additional protection from future development. The wetland delineation was approved by the MDEQ as accurate and the owner received a wetland permit based on the delineation.

Key Volunteering Ecological Experience with the Huron River Watershed Council

Volunteer participant for many on-going projects including the following:

- Participant in the Annual Stream Measuring and Mapping of creeks and rivers in the watershed – Field collection of bank structure, channel and streambed data, patterns of flow, stream velocity and discharge calculations to provide overall ecological habitat quality (2007 to present).
- Stream gauging and water quality data collection – Captain of the biweekly assessments of Honey Creek, including stream flow gauging, and water chemistry and quality data collection. Data is used to determine e. coli concentrations and phosphate load carried by Honey Creek and the total maximum daily loading to the Huron River (2007 to present).
- Team Leader in the Annual Stonefly Collection – Collection of stoneflies from watershed streams in creeks annually in January used in assessing the health or degradation of the waterbody (2006 to present).
- Team Leader in the Semi-annual River Roundup – Collection of benthic macroinvertebrates in watershed streams and creeks used in assessing the ecological diversity and function of the macroinvertebrates in the stream or creek (2006 to present).
- Surveyor - Bioreserve Project: Rapid Ecological Assessment of Natural Areas in the Huron River Watershed – Field identification and assessment of the remaining natural, undeveloped lands in the watershed. Data collection included categorizing undeveloped land and surrounding areas by ecosystem, habitat and function, and prioritizing undeveloped property for field assessment and protection (2007 and 2008).
- Plant Expert in the Bioreserve Field Assessment of Natural Areas in the Huron River Watershed – Field assessment of wetlands, forests, grasslands and creeks for plant identification; vegetation structures, including tree size distributions, native vs. invasive species distribution; soil identification; signs of human disturbance; stream bank and water quality data. Data collected is scored to aid in determining the preservation ranking (2008).
- Participant in fundraising events and education awareness projects including Suds on the River and the Miller's Creek Film Festival (2007).

TETRA TECH

Joy Gryzenia
Project Geologist

Ms. Gryzenia is a Project Geologist with over 2 years of experience performing soil and groundwater sampling using multiple sampling techniques, and has completed vertical profiling of shallow and deep aquifers for groundwater monitoring purposes. Ms. Gryzenia has experience with contractor oversight, drilling and well installation using hollow stem auger, roto-sonic, and direct push drilling methods. She has worked on soil boring, recovery, and well installation including observation, monitoring, injection and extraction wells. She has also assisted in in-situ application of integrated carbon and zero valent iron for treatment of nickel and chromium impacts using direct push drilling methods. Ms. Gryzenia has experience with excavation oversight and is trained in using a Leica 1200 global positioning system (GPS) for surveying. She routinely assists project managers with gINT, Mining Visualization Software (MVS), Microsoft excel, access and word, writing closure reports, proposal preparation, and performing Phase I site assessments.

Proficient in the following computer programs: Mining Visualization Software (MVS), Microsoft Office suite of programs: Word, Excel, Power Point and Access.

Education:

M.S., Geosciences, Western Michigan University, Kalamazoo, Michigan, 2010

B.S., Geology, Grand Valley State University, Allendale, Michigan, 2008

Hydrogeology Field Camp, Western Michigan University, Kalamazoo, Michigan, 2009

Indiana University Geologic Field Station, Indiana University, Cardwell, Montana, 2008

Registrations/Certifications:

8-Hour HAZWOPER Refresher, 29 CFR 1910.120 (e)(8) OSHA, 2010 to present

40-Hour HAZWOPER Training + 24-Hours of Field Training, 29 CFR 1910.120 OSHA, 2009

Adult First Aid, CPR, and AED certified, 2012

e-RAILSAFE Contractor certified (2011)

CN – Rail Safety certified (2012)

EXPERIENCE

Environmental Site Characterization and Property Transfer

East Stadium Boulevard Bridge Project, Ann Arbor, Michigan – Staff geologist responsible for sampling a soil characterization plan prior to replacement of the East Stadium Boulevard Bridge and associated and nearby utility infrastructure. Responsibilities included reviewing nearby facility data, aiding the senior geologist in developing a sampling plan for infrastructure routes along the boulevard and the six earthen walls surrounding the bridge, implementing a hand auger and direct push drilling plan, completing a statistical analysis of soil concentrations above applicable criteria and preparing a letter report of findings and recommendations. The age of the fill used to build the earthen walls surrounding the bridge and the past industrial uses in the area required an extensive sampling plan. Additional area information and statistical analysis were used to reduce the sampling parameters and coordination with local landfill operations prior to sampling implementation helped to reduce the overall number of samples required.

Phase III Soil and Groundwater Investigation, Confidential Client, Michigan – As Staff Geologist, was the field lead for a Phase III soil and groundwater investigation to identify previously recognized concerns at an inactive particle board manufacturing plant. Lithology was logged and shallow soil samples were collected using GeoProbe direct push drilling methods. A shallow groundwater investigation was completed by vertically profiling the groundwater for nitrate, total dissolved solids and specific conductivity. Temporary monitoring wells were installed at the depth with the highest parameter of concern and the wells were sampled using low-flow techniques. A deep groundwater investigation was also conducted in 4 locations, using roto-sonic drilling techniques. Again, vertical

profiling was conducted for nitrate, total dissolved solids and ammonia and monitoring wells were installed and sampled.

Soil Impact Delineation and Characterization, Canadian National Railroad, Detroit, Michigan – Staff geologist responsible for assisting the senior geologist in developing a sampling plan at a former railroad junction and carrying out the soil delineation and characterization sampling plan. As field lead, completed test pits and soil borings to delineate an abandoned diesel fuel line and its associated impacts. Using survey equipment, coordinates of the sample locations were collected. Sample results were analyzed and a remediation plan and focused feasibility are being developed.

Laser Induced Fluorescence Soil Characterization, Canadian National Railroad, Detroit, Michigan – Project Geologist responsible for assisting the senior geologist in developing a delineation plan using laser induced fluorescence (LIF) and carrying out the soil delineation. As field lead, completed LIF borings to delineate diesel fuel impacts at the site. Soil samples were collected from three borings to correlate soil analytical results to LIF result borelogs.

Soil and Waste Sampling, Confidential Client, Jackson, Michigan - Completed soil borings using the hand auger drilling method to collect soil samples for PCB analysis. Additional sampling was completed to determine whether the source of PCBs was originated from the waste on site. Test pits were completed with a backhoe, soil was screened with a PID, and the soil was described and documented. Assisted the project manager in data analysis and report organization.

Municipal Waste Landfill, Ann Arbor, Michigan – Staff geologist responsible for oversight of a leachate outbreak repair. A leachate outbreak was discovered in the summer of 2006, and after investigating the cause of the outbreak, a clay cap repair was implemented. Vegetation and upper topsoil was removed and stockpiled for later use. Clay meeting the requirements for hydraulic conductivity was added in lifts, totaling 2 feet. Compaction testing was completed before 6 inches of topsoil was added and compacted. Grass seed, fertilizer, and straw was added as final cover.

Submerged Oil Task Force, Enbridge Oil Release, Marshall, Michigan – Used a Leica GPS unit to stakeout to possible submerged oil locations along a 38-mile long portion of the Kalamazoo River. Also took survey locations of highly oil contaminated areas, and delineated the extent of oil in these areas. Sampling of the sediment core samples collected along the Kalamazoo River was also completed.

Phase I Site Assessment, Baker College, Port Huron, Michigan – Completed a Phase I site assessment for Baker College in Port Huron, Michigan. The assessment included a site walk, contacting former property owners and conducting interviews, reviewing aerial photographs, topographic maps, and soil classification maps, and reviewing a radius map report.

Phase I Site Assessment, ADESA, Bay City, Michigan – Assisted a project manager with a Phase I site assessment for ADESA, Inc., in Bay City, Michigan. The assessment included reviewing aerial photographs, topographic maps, soil classification maps and reviewing a radius map report to identify recognized environmental concerns in the area.

Phase I Site Assessment, City of Port Huron, Port Huron, Michigan – Assisted a project scientist with a Phase I site assessment for the City of Port Huron in Port Huron, Michigan. Ms. Gryzenia's role included a site walk, reviewing aerial photographs, topographic maps, soil classification maps and reviewing a radius map report to identify recognized environmental concerns in the area.

Phase I & Phase II Site Assessment, SmithGroupJJR, City of Ann Arbor, Michigan – Completed a Phase I site assessment for SmithGroupJJR for a former fleet services center and city garage in Ann Arbor, Michigan. The assessment included reviewing aerial photographs, topographic maps, soil classification maps, Sanborn maps, city directories, and a radius map. Ms. Gryzenia helped to identify recognized environmental concerns in the area and completed a site walk and interview. A Phase II sampling plan was developed after completing the Phase I site assessment. Ms. Gryzenia aided in developing the sampling plan and cost estimates.

Remediation Project Experience

Municipal Waste Landfill, Ann Arbor, Michigan – Staff geologist responsible for completing well installations and injection of an emulsified vegetable oil (EVO) created by EOS™ as part of a bioremediation pilot test. The pilot test was initiated to treat a vinyl chloride plume downgradient of the City's municipal solid waste landfill. Responsibilities included drilling oversight for installation of seven injection wells and one observation well, recording lithology, sampling soil, creating digital well logs and developing observation and injection wells with a peristaltic pump. Injections were delivered through an eight-channel manifold system connected to each injection well from 55 gallon drums of EVO. The EVO injections were followed by a water flush using the City's water hydrant.

Automotive Manufacturing Facility, Confidential Client, Michigan - Staff Geologist responsible for *in-situ* Application of EHC-M™ a reductive zero-valent iron substrate utilized in metal fixation, as a chemical and bioremediation technique for chromium and nickel contamination. Using direct push drilling methods, soil borings were pushed to depth, and injections of integrated carbon and zero valent iron were completed. Ms. Gryzenia assisted the project manager in planning, data analysis and performance monitoring sampling.

Automotive Manufacturing Facility, Confidential Client, Michigan – Staff Geologist responsible for excavation oversight and oil water separator installation of a 33,000 square foot area with PCB impacts. Ms. Gryzenia oversaw the installation of two oil water separators in a wetland area. Took soil samples to verify the contaminant was removed to below detection limits. Wetland restoration was completed after the impacted soil was removed. Assisted the project manager with data analysis, and writing a report for clean closure.

Bioaugmentation and Groundwater Sampling, Visteon Systems, LLC, Connersville, Indiana - As Staff geologist, performed groundwater sampling to monitor performance of in-situ groundwater bioremediation systems. Performed low flow sampling to demonstrate compliance for a regulatory agency. Completed injections of bacteria for purposes of creating an anaerobic biological groundwater treatment zone.

Automotive Manufacturing Facility, Confidential Client, Michigan – Staff Geologist responsible for a soil investigation and hazardous waste excavation oversight. Ms. Gryzenia planned and oversaw a delineation investigation of VOC contaminated soil. The area is a former landfill that was previously excavated, but still had high levels of trichloroethene and its daughter products. The area of concern was separated into a grid pattern and

was sampled using the direct push drilling method. Samples were collected in accordance to ST3M regulations and were submitted for laboratory analysis. The delineation sampling lead to planning a phased-approach excavation. A phased approach was planned because the area of concern was partially located in a wetland, requiring a wetland permit before excavation activities could begin. Ms. Gryzenia was the field lead for the excavation that removed over 700 tons of hazardous soil and 9000 tons of non-hazardous soil. Level C personal protective equipment was

maintained during the hazardous waste excavation, requiring the use of personal air monitoring badges on all personnel involved in the excavation activities. Continuous air monitoring was completed using an LEL and PID to ensure worker's safety. Ms. Gryzenia assisted in data analysis, and planning of the excavation. Assisted the project manager in writing a work plan addendum and work plan addendum 2 to be submitted to the state. Mining Visualization Software (MVS) was used by Ms. Gryzenia to create maps and cross sections of the impacted subsurface. Once the excavation phases were complete, Ms. Gryzenia assisted in the writing the interim measures implementation report, completed data analysis tables, compiled appendices and waste documents.

Automotive Manufacturing Facility, Confidential Client, Michigan – Staff Geologist responsible for overseeing a horizontal well installation for a soil vapor extraction system. Oversaw the installation of two horizontal wells, each over 400 foot long, that reached under the floor of the manufacturing plant, to aid in the extraction of hazardous soil vapors. Duties included tracking the progress of the drilling, documenting field events, and contractor coordination.

Automotive Manufacturing Facility, Confidential Client, Michigan – Staff Geologist responsible for aiding in the planning and developing of a soil investigation and overseeing an impacted soil excavation. Assisted in the development of a sampling plan at a former chromium waste treatment facility. The treatment facility was scheduled to be demolished, but before a soil sampling event was completed to determine whether the underlying soils were impacted. After the investigation, sample results were analyzed and it was determined that the soil was impacted. A delineation sampling event was completed and impacted soils were excavated. As a staff geologist, Ms. Gryzenia was responsible for excavation oversight and disposal paperwork. Ms. Gryzenia assisted the project manager in writing a work plan addendum to be submitted to the state. Mining Visualization Software was used to create maps and cross sections of the impacted subsurface.

Automotive Manufacturing Facility, Confidential Client, Michigan – Project Geologist responsible for aiding in the planning of a landfill cap repair and overseeing the contractors work. Construction debris that was exposed at the surface was removed and transported to a landfill. The area was then covered with topsoil and seeded.

Municipal Waste Landfill, Ann Arbor, Michigan –Staff Geologist responsible for overseeing the installation of a new discharge line, two purge wells, and two acid injection wells at a Muncipal Waste Landfill. Two damaged purge wells and two acid wells were abandoned and the replacements were installed near the locations of the previous wells. Before determining the well depth, soil samples were collected using a split spoon sampler and lithology was logged by the staff geologist. Ms. Gryzenia also assisted in the development of a letter report to the city and county describing field activities and well construction details.

Groundwater Sampling

Automotive Manufacturing Facility, Confidential Client, Michigan - As a Staff Geologist, performed monthly, quarterly, and yearly groundwater sampling using low-flow techniques to collect water samples for laboratory analysis of various parameters.

Groundwater Sampling, City of Hartland, Michigan - Performed annual groundwater sampling using bailer, low-flow and high-flow techniques to collect water samples for laboratory analysis of various parameters.

Groundwater Sampling, Confidential Client, Michigan – Performed quarterly groundwater sampling using modified high-flow techniques to collect water samples for laboratory analysis of various parameters. A submersible pump was used to purge the well, and an MP20 water quality meter was used to collect and record water quality parameter readings.
