

## White Buffalo Sharpshooting Basics

- Sites are selected based on topography to provide a proper earthen backstop (hillside, swales, etc.)
- When possible, shots are taken from a downward angle to provide an additional level of safety
- All unnecessary vegetation is removed to ensure there is nothing that can deviate the shot from its intended target
- Small caliber, highly frangible ammunition is used.
- If there is any question about the validity of a shot it is not taken.

## General White Buffalo Sharpshooting Procedures

1. Prior to initiating any field activities the target area/s and surrounding properties are thoroughly surveyed using digital aerial imagery followed by field confirmation. By knowing the location of every occupied structure and areas of human use we are better able to work safely, discretely, and efficiently.
2. During the removal operation we search intensively for people and non-target animals to avoid unsafe conditions.
3. During deer removal operations there will be continuous open communication between Ann Arbor Police, University of Michigan Police and White Buffalo, Inc. to keep people well informed regarding field activities in order to avoid any potential safety issues.
4. All carcasses are transported with the highest degree of discretion.
5. Sharpshooting operations will cease immediately if unsafe conditions (i.e. unauthorized personnel in fire zones, weather/road conditions, protestors, etc.) are encountered and will not be resumed until conditions are deemed safe.
